Dick:

I attach a copy of Wilf's memo on SprayDon A dust.

While we will be able to make minor improvements in the dusting of A, I am convinced that we will not be able to meet the requirements described by Stan. It seems that neither would anyone else with a product containing 30% asbestos. While the plant and others will continue their efforts for improvement, it is pointless to assure you that the problem can be answered with the present formula.

Wilf urges that you provide us with a formula containing low amounts of asbestos. A "G" formula overcomes our original problem. I concur in his conclusions.
