Attn: Miss Jeanette Garner,
Purchasing Agent

Gentlemen:

"Pumice is chemically described as being a silicate of alumina. It is an inert volcanic pigment; non-flammable; has no known toxicity; and chemically is considered to be non-hazardous.

The material safety data sheet as described in U. S. Dept. of Labor Form LSD-00-S-4 has no application since Pumice is an unreactive mineral substance having no known hazards, therefore, essentially no safety precautions are necessary in handling this material."

This is what we send out by the dozens every week and trust it will be satisfactory for your customers.

Very truly yours,

CHARLES B. CHRYSTAL CO., INC.
