TABLE OF CONTENTS

Executive Summary	3
Section 1: Introduction	4
Section 2: Data Description	
Distribution of autopsies by year & ethnic group (1975-1999)	5
Number of autopsies by age & ethnic group (1999)	6
Number of autopsies by type & ethnic group (1999)	7
Number of autopsies by industry & ethnic group (1999)	7
Number of autopsies by years of service & ethnic group (1999)	8
Mean duration of service and mean age by type of mine & ethnic group (1999)	9
Section 3: Active Tuberculosis	
Distribution of active tuberculosis by anatomical site (1999)	10
Number and prevalence of pulmonary tuberculosis by age & ethnic group (1999)	11
Number and prevalence of pulmonary tuberculosis by industry & ethnic group (1999)	11
Section 4: Silicosis	
Number and prevalence of silicosis by industry & ethnic group (1999)	12
Number and prevalence of silicosis in gold miners by age & ethnic group (1999)	13
Section 5: Massive Fibrosis, Coal Workers' Pneumoconiosis, Mixed dust Fibrosis & Asbestosis	14
Number and prevalence of asbestosis by age & ethnic group (1999)	15
Section 6: Emphysema	
Number and prevalence of emphysema by age & ethnic group (1999)	16
Number and prevalence of emphysema by industry & ethnic group (1999)	17
Number and prevalence of emphysema by years of service & ethnic group (1999)	17
Section 7: Mesothelioma	
Number of mesothelioma cases by age & ethnic group (1999)	18
Number of mesothelioma cases by industry & ethnic group (1999)	18
Section 8: Primary Lung Cancer	
Number and prevalence of primary lung cancer by age & ethnic group (1999)	19
Number and prevalence of primary lung cancer by industry & ethnic group (1999)	20
Section 9: Causes of death	
Causes of death by ethnic group (1999)	21
Appendix:	
Distribution of autopsies according to the last mine the deceased worked at	22

EXECUTIVE SUMMARY

South African law requires the examination of the cardiorespiratory organs of deceased miners and ex-miners for compensation purposes, provided the next of kin agrees. These examinations are performed at the National Centre for Occupational Health (NCOH) and the findings are recorded on a computerized database (PATHAUT). This database provides an important resource for surveillance and research.

During 1999, 2529 cases came to autopsy at the NCOH. Of these, 65.5% were black men, 32.9% whites, 1.1% coloureds and 0.5% were submitted without information on the ethnic group.

Overall disease rates (per 1000 cases) for 1999 are as follows:

SECTION 1 – INTRODUCTION

The Pathology Department of the National Centre for Occupational Health (NCOH) provides an autopsy service for miners and ex-miners to determine the presence of occupational lung disease. Under the Occupational Diseases in Mines and Works Act (ODMWA, 1973) it is obligatory for the last attending doctor to remove the cardiorespiratory organs and send them for examination provided the next of kin agrees. A detailed report of each case is sent to the Medical Bureau for Occupational Diseases (MBOD). Cases certified as having a compensatable disease are then referred to the Compensation Commissioner's office, where payment of compensation is managed.

Since 1975 the pathological findings have been recorded on the PATHAUT database which is a unique computerized source of information for research. PATHAUT combines data from autopsy summary sheets and clinical files (including occupational histories) onto a single database. The structure of this database was changed in 1995/1996 and new programs were written, upgrading and enhancing the existing database by improving the quality of the system and making better use of existing data (SIMRAC Project GEN509).

This is the third of the new format reports and describes autopsy cases examined during 1999.

Data from PATHAUT are exported into the Statistical Analysis System (SAS System) where programs have been written using the Structured Query Language (SQL) permitting the user to analyze data on the SAS System related to any aspect of the PATHAUT database. During 1998 this was done for the 1975-1995 database, converting these data to a similar format as the current PATHAUT database.

SECTION 2 – DATA DESCRIPTION

The number of autopsies performed since 1975 is presented in Table 2-1.

**TABLE 2-1 DISTRIBUTION OF AUTOPSIES BY YEAR & ETHNIC GROUP
(1975-1999)**

Year of autopsy	Black		White		Coloured		Indian		Unknown		Total N

* Computerized data for only ± 6 months are available for this year

It is important to note that there is a referral bias in that black men are infrequently autopsied after leaving employment in the mines, whereas the majority of whites come to autopsy after retirement.

The age distribution of autopsies for 1999 is shown in Table 2-2 and Fig 2-1. In 1999 the mean age for black miners was 40.1 years (37.9 in 1998) and for white miners 61.8 years (61.3 in 1998)

TABLE 2-2 NUMBERS OF AUTOPSIES BY AGE & ETHNIC GROUP (1999)

FIG 2-1 DISTRIBUTION OF AUTOPSIES BY AGE & ETHNIC GROUP(1999)

The pathologists at the NCOH perform 2 types of examinations. For men dying distant from Johannesburg, the cardiorespiratory organs are removed locally, preserved in formalin and sent to the NCOH. Full autopsies are undertaken on men who die close to Johannesburg.

Table 2-3 presents the distribution of autopsies by ethnic group for 1999. Autopsies of cardiorespiratory organs only comprised 92.9% of examinations.

TABLE 2-3 NUMBER OF AUTOPSIES BY TYPE & ETHNIC GROUP (1999)

	Black		White		Coloured		Unknown		TOTAL	
	N	%	N	%	N	%	N	%	N	%

Table 2-4 and Figure 2-4 show the distribution of autopsies by industry and ethnic group for 1999. The majority of miners were from the gold mining industry (75.8%). 86.2% of coloured miners came from asbestos mines.

TABLE 2-4 NUMBER OF AUTOPSIES BY INDUSTRY & ETHNIC GROUP (1999)

FIG 2-4 DISTRIBUTION OF AUTOPSIES BY INDUSTRY & ETHNIC GROUP (1999)

* Includes copper, diamond, quarry, silica (silicon smelters), manganese, tin, zinc, minerals, chrome and iron as well as cases where information about type of mining is missing

Detailed information about the years in mining service by ethnic group is given in Table 2-5. This is also presented in Fig 2-5. Cases are categorized according to the industry in which most years of service occurred. The percentage of cases with missing information on the duration of service is 22.7%, down from 43% in 1998.

SECTION 3 – ACTIVE TUBERCULOSIS

Active tuberculosis was diagnosed in 15% (387) of all the cases autopsied in 1999 (Fig 3-1), in comparison with the 510 (18%) cases of the previous year. The distribution of tuberculosis (TB) by anatomical site is presented in Fig 3-1. 80% of TB cases had active **pulmonary** tuberculosis (PTB). Of the PTB cases, 88% involved the lungs extensively. 92.9% (288 cases) of PTB cases were black, 5% (16 cases) white, 2% (5 cases) coloured miners and in 0.3% (1 case) the ethnic group was unknown. 75% of all PTB cases came from the gold mines and most of the PTB cases were in the age group 40-49.

Fig 3-1 Distribution of active TB by site (1999)

In 65% of cases of pulmonary tuberculosis found at autopsy, the disease was not mentioned in the clinical notes which were submitted with the organs.

The age distribution of cases with active pulmonary TB is shown in Table 3-1. The difference in age distribution between ethnic groups might be explained by different referral patterns (page 3). The rate of PTB in 1999 (122.6/1000) is lower than in 1998 (149.0/1000).

TABLE 3-1 NUMBER & PREVALENCE OF ACTIVE PTB BY AGE & ETHNIC GROUP (1999)

Rate per 1000; *because of small number of cases in denominator these rates may not be reliable; Denominator: All autopsies in specific age group for specific ethnic group

The distribution of active PTB cases by industry is shown in Table 3-2. 75.2% of active PTB cases came from the gold mining industry (75.8% of all autopsy cases came from that industry). The rate of PTB in the gold mining industry of 121.5/1000 is lower than in 1998 (172.0/1000), whereas the rates in all other commodities have increased.

TABLE 3-2 NUMBER & PREVALENCE OF ACTIVE PTB BY INDUSTRY & ETHNIC GROUP (1999)

Industry	Black		White		Coloured		Unknown		Total

TOTAL	288	173.9	16	19.2	5	172.4	1	83.3	310	122.6

Rate per 1000; *because of small number of cases in denominator these rates may not be reliable; Denominator: All autopsies in a specific industry for specific ethnic group

SECTION 4 – SILICOSIS

Silicotic nodules were found in the lungs in 336 cases, 13.3% of all autopsies, compared with 16.0% in 1998. 93.6% of these cases came from the gold mining industry. Of all cases of silicosis, occasional silicotic nodules were found in 39.8%, a few in 17.6%, a moderate number in 26.2% and a large number in 16.4%.

The distribution of cases with silicosis by industry and ethnic group is presented in Table 4-1. As indicated previously, cases are categorized according to the industry in which the most years of service occurred. Cases from the platinum mining industry with silicosis might be explained by unstated previous service in gold mines.

TABLE 4-1 NUMBER & PREVALENCE OF SILICOSIS BY INDUSTRY & ETHNIC GROUP (1999)

SECTION 5 – MASSIVE FIBROSIS, COALWORKER'S PNEUMOCONIOSIS, MIXED DUST FIBROSIS & ASBESTOSIS

MASSIVE FIBROSIS

There were 20 (0.8%) cases of massive fibrosis (12 black, 8 white) and the majority of them (80%) came from the gold mining industry.

COAL WORKERS' PNEUMOCONIOSIS

There were 11 cases of coal workers' pneumoconiosis most in the age group 60-69 (36%).

MIXED DUST FIBROSIS

There were 5 (0.2%) cases of mixed dust fibrosis of whom 60% came from the gold mining industry.

ASBESTOSIS

There were 34 (1.3%) cases of asbestosis of which 35% had slight interstitial fibrosis, 53% moderate and 12% marked. Amongst all cases with a history of asbestos exposure, there were only 8 in whom asbestos plaques were found. However, the parietal pleura which is usually the site affected by plaque formation is hardly ever submitted with the lungs.

All of the coloured miners with asbestosis came from asbestos mines as did the majority of blacks and whites with this disease.

The distribution of asbestosis by age and ethnic group is shown in Table 5-1.

TABLE 5-1 NUMBER & PREVALENCE OF ASBESTOSIS BY AGE AND ETHNIC GROUP (1999)

FIG 6-1 DISTRIBUTION OF EMPHYSEMA BY AGE & ETHNIC GROUP (1999)

For black and white miners with emphysema, the majority were from the gold mining industry (68%) (Table 6-2), whereas most coloureds came from asbestos mines (most autopsies on coloureds were referred from these mines)

SECTION 7 – MESOTHELIOMA

In comparison with the 19 cases of 1998, there were 24 cases of mesothelioma in 1999. The distribution of mesothelioma by age and ethnic group is presented in Table 7-1.

TABLE 7-1 NUMBER OF MESOTHELIOMA CASES BY AGE & ETHNIC GROUP (1999)

Age Group	Black		White		Coloured		TOTAL	
	N	%	N	%	N	%	N	%
30-39	2	25.0	0	-	0	-	2	8.3
50-59	5	62.5	4	26.7	0	-	9	37.5

TOTAL	8		15		1		24	

*2 February 2006. In an earlier print run of this report, the total number of mesothelioma cases was given as 22. Changes have been made to the text and tables.

SECTION 8 – PRIMARY LUNG CANCER

63 cases of primary lung cancer were found at autopsy (84 in 1998) of which 17.5% were in black miners, 76.2% in whites and 6.3% in coloured miners. Most of the cases were of the squamous cell type (27%), followed by lung adenocarcinoma (24%), large cell type (22%), small cell type (21%) and bronchoalveolar carcinoma (6%).

The distribution of primary lung cancer by age and ethnic group is presented in Table 8-1 and Fig 8-1. Black miners were in the age group 40-59 whereas the highest proportion of whites and coloureds were 60-79 years old.

TABLE 8-1 NUMBER AND PREVALENCE OF PRIMARY LUNG CANCER BY AGE & ETHNIC GROUP (1999)

Age group	Black		White		Coloured		TOTAL

The prevalence of lung cancer by age (a) and industry (b) is shown in Figure 8-2.

FIG 8-2 PREVALENCE (PER 1000) OF LUNG CANCER BY AGE (a) & INDUSTRY (b) FOR BLACK AND WHITE MINERS (1999)

SECTION 9 – CLINICAL CAUSES OF DEATH

Table 9-1 & Figure 9-1 shows the clinical cause of death which accompanied the cardiorespiratory organs by ethnic group. Diseases of the respiratory system were the most frequent (48.4%). Black miners had the highest proportion of unnatural causes of death (20.2%). In 17.4% the cause of death was not stated.
