

Barium Sulphate for X-Ray Protection

WHEN properly mixed and applied as wall plaster (pat. appl. for on process), Barium Sulphate makes the ideal protection against X-rays and Gamma rays of Radium.

It is important that the mix contain only Barium Sulphate, Barium Sand and Cement. It is obvious that the introduction of ordinary sand reduces the Barium content of the wall to a negligible factor.

For proper proportions and further details write or wire.

X-Ray protection with wall plaster

IT is impossible for either X-Rays or the gamma rays of radium to penetrate walls to which barium sulphate plaster* has been applied. Giving the appearance of ordinary wall plaster, barium sulphate plaster offers protection against X-rays of 200,000 volts. Moreover it is less expensive and offers a more pleasing appearance than the old methods of protection.

Details, formula and specifications will be furnished upon application.

X-RAY PROTECTION WITH PLASTER

BARium sulphate plaster is being used as a means of protection not only on the walls of X-ray rooms in many hospitals but in the offices of doctors who have X-ray equipment. Doctors who work with X-ray apparatus have been quick to appreciate that the walls of their offices may now be made X-ray-proof at a relatively low cost and in an attractive way.

Barium sulphate plaster is applied over wood or metal lath in the same manner as ordinary plaster. It is like ordinary plaster in appearance. Likewise it may be painted.

If you are interested in barium sulphate plaster for X-ray protection, we shall be glad to furnish further details, formula and specifications upon application. (Patent applied for on process.)
