SUBJECT	<u>EPA RECOVERY OF AR 901 - ESR 1006</u>				

We have begun to develop a procedure for recovery of AR 901 which potentially can satisfy EPA requirements. Unfortunately, only three tests were run when it became apparent that a sight glass would be needed in the recovery line to allow for visual detection of foam to prevent damage to the compressors.

A work order was submitted last year to install a "bulls-eye" sight glass to allow our development work to proceed. This work order continues to get back-burner priority. In order to meet our EPA compliance schedules, this sight glass is needed. Can you expedite its installation?
