those studies?

A Oh, yes.

Q What are they?

A Basically their findings were essentially the same as ours. 99.97 plus percent of the asbestos is converted, number one.

Number 2, the fiber length of the emitted fibers is less than by a substantial amount than what is required to be called an OSHA fiber.

One of the studies, I think, indicated the fiber length was more like .5 microns. We found about .7 microns, but they were all short fibers.

And basically the wear characteristics during braking during normal usage at high temperatures were quite similar to what we had and basically all four tests supported one another. They were mutually consistent.

Q Okay.

MR. WILLIAMS: If I may, Your Honor, I will just get the exhibits back.

I would like to offer into evidence Ford
