REFERENCE

ATTENTION

SUBJECT

Re your memorandum of October 17, I think that the samples of Aroclor (Lot S-13) and the benzene you used to obtain the cell constants should be sent by you or Mr. Barker to Springfield for DC measurements. They should be directed to Dr. Telfair. (I note his name is misspelled by accident in your memorandum.)

I don't see how the lead capacitance is so very high as compared to the cell constant in either type of cell. Can you explain this?

R. R. Jenkins
