by infiltration of the tumor into the chest wall tissue.

Q Now, Mr. Grewe, did he develop another pleural effusion after that first one?

A Yes.

Q And how quickly, or when did that occur?

A Very quickly. They did another thoracentesis about a week later.

Q And was he diagnosed with mesothelioma at that time?

A No. The cytology report from those two specimens that I reviewed showed those what is called a class three, which means there were atypical cells present in that fluid, but not cells diagnostic of malignancy.

Q Did Mr. Grewe's condition improve, from your review of the record?

A It improved a little bit, but not very much.

He really continued to have chest wall pain, continued to have shortness of breath and continued to
