

- Attachment 9 briefly discusses results for these monitoring tests.
- Attachment 10 again briefly discusses results from personnel monitoring tests and also in Attachment 11.

As a result of the extensive monitoring evaluations made from 1966 to mid-1972 (over 177 tests), Chambers Works evolved a program designed to minimize occupational exposure and to maintain occupational exposure below accepted, recognized limits.

The effectiveness of the Chambers Works asbestos handling program is demonstrated by the fact that over 1,000 monitoring samples have been taken since mid-1972 and in only one case were the accepted limits exceeded and that individual was wearing full protective equipment.

The thrust of the program developed by Lynch and Thatcher is:

- Use of strict procedures for asbestos handling.
- Barricade areas when asbestos handling occurs.
- Keep all other personnel out of the barricaded areas when asbestos handling is in progress.
- Monitor personnel who are handling asbestos within the barricaded areas.
- And monitor the perimeter of the barricades to assure that the barricades have been properly placed.
