SUBJECT AROCLOR

REFERENCE

TO : H. A. Vodden
RUABON

We have carried out two-year feeding testing on dogs and rats with three representative members of the Aroclor group. There have been no evidences of any carcinogenic properties of Aroclors as a result of this feeding experiment. In our manufacture and sale of Aroclors for over 35 years, we have never heard of any report of an occupationally induced cancer occurring in our workers.
