Subject: Asbestos Free Talc in M4D166A

Reference: Memo Mosher to Woods, dated 11/8/73

On December 21, 1973, Production began using United Sierra's Beaver White 200 asbestos free talc within our M4D166A material, thereby eliminating the asbestos problem in and around the talc blending and the extrusion areas. To my knowledge, and based upon our inspection of the blending area, there is no Desert 51 talc (previous production material) remaining in the plant. As noted in the referenced memo, we have also significantly reduced the amount of extraneous talc dust around the system by various equipment modifications.

This memo is to inform you of our progress and to request your assistance in determining remaining OSHA requirements in this area.
