and Dr. Spirtas is an epidemiologist at the National Cancer Institute. And they look at about 259 mesothelioma cases and the controls in New York and in California, and, again, they calculate relative risk for different occupations.

For the first one -- actually, the first one I didn't put down everything there, it should be installation and repair of boilers and furnaces.

Q Okay.

A The risk was 4.5 associated with installation or repair of boilers or furnaces.

For shipbuilding and repair, it was about 4.3. The normal population 1.0.

And in the NCI study, they actually look at a very specific operation, brake installation and repair. For that occupation, the relative risk was exactly 1.0.

Q Okay. So with respect to the other studies, they are actually talking about various types of people who work in the garages?

A Well, mechanics.
