Subject: ASBESTOS SURVEY No. 1 RESULTS GLOUCESTER (3/4/77)

Results of asbestos monitoring in the Gloucester Powerhouse on March 4, 1977 are included in the attached report from CEED.

It is imperative that instructions reviewed with Messrs. Janosky and Van Cleve relative to work on removal and repair of asbestos containing insulation be closely supervised. The potential for overexposure would appear to exist if the recommended work practices are not followed.

We suggest that the employees monitored be appraised that results were below permissible levels and with the use of the respirator, actual breathing zone concentrations were further minimized.

Except for some Calsilite that is still available for use in the plant, we note that all Plibrico materials contain no asbestos. However, during my recent visit we found some unlabeled bags of insulating materials in the Powerhouse store room. Has any determination been made as to what this material is? Please advise.

W. Fassuliotis
