Proposed P-Bulletin on Interlocks

Replies from some operating areas indicated disagreement with the bulletin as written. Also, Dennis Kos presented to SAC an operating procedure which he intends to use for the control of interlock by-passing in the styrene plant. After considerable discussion it was decided to work up a revision of the proposed bulletin for review by operating personnel by the November PMSB meeting.

Plant Telephones for Emergency Use when a Power Failure Occurs

The changes approved by the PMSB in September in some of the 10 telephones which operate when normal power for phones is off are being implemented.

At the September PMSB meeting a concern was raised as to whether the plant had sufficient communications under these conditions and SAC was requested to review this concern and recommend improvements if needed. Since then LP&S and communications personnel have begun a study on this subject. SAC will review their recommendations when the study is completed.

Ladder Inspection

SAC recommends that the annual ladder inspection next year be done plantwide in a single week to reduce the possibility of missing an inspection due to ladder movement. It is also recommended that ladders be issued out of stores on a replacement basis (bring your old ladder for trade-in), or with the General Superintendent approval.

will be dropped *trade out*
is over control

Contact Lenses

A new corporate policy on the wearing of contact lenses was discussed. LP&S and personnel will be working on plans for implementation at the Texas City plant.

Need to be consistent with MCI plants esp. Keyou.

Essentially policy is you don't wear in chemical environment without medical dispensation
