Dr. O. E. Fancher
624 N. Abrego Drive
Green Valley, Arizona 85614

Dear Otis:

The information which you requested for J7300 and J8746 is as follows:

1. You were correct, as usual. The errors which you mentioned do exist and should properly read as you noted. Should this be re-issued correctly? Or will you call this to MLK's attention?

2. The J7300 chickens were received 5-7-69. Dosing began when they were 12 weeks old, therefore, they were 10 1/2 weeks old when acquired.

3. J7300 Chick Viability is enclosed.

4. Enclosed letter to Dr. Ray Loan is self-explanatory.

5. Malignant lymphoma or Leucosis Complex in the chicken is characterized by excessive hyperplasia of the liver, kidney and gonads. I would assume that the "extensive growths" referred to in the J7300 report are of this etiology.

6. Categorization of the egg defects was not called for in the protocol of either J7300 or J8746. This data was not categorized for J8746. We are currently starting two such investigations for Monsanto. Would you advise recording this data?

I had hoped this snake wouldn't be exhumed, but no such luck. The conduct of this project (J7300) finally led to the demise of Jim Stephens. Accordingly, I am not happy with the way it was done.

We're getting on fairly well here at WCRF. I'm sure it is some satisfaction to you to see the Farm becoming an integral part of BIO-TEST. I hope you are pleased with your new situation and that you share some mutual warm thoughts with us at Christmas Time.
