DOCUMENT DESCRIPTION: Sales Literature

Every 49 seconds another bomb casing with tail end heated to 2100° F. leaves Tocco unit for spinning. Tocco heat-treating unit's made by The Ohio Crankshaft Company, Cleveland.

What keeps Tocco's insides clean?

Tocco is a machine to heat-treat steel by electrical induction.

Tocco units make better bomb cases. Heat airplane propeller ends to 2100° F. in 115 seconds. Increase output of drill chucks 600 per cent. In addition to hundreds of manufacturing plants faster production, lower cost and improved products.

Tocco's insides consist of expensive, precision machinery. A motor-generator is its heart. To assure proper operating temperature for the enclosed electrical

equipment, air is fan-circulated throughout the cabinet. This air must obviously be clean as a whistle. Dust-Stop* Air Filters inside the intake louvres (see inset) make it that way.

Saves Possible Expense

Dust-Stops are one of the contributing factors to Tocco's remarkably low maintenance costs, made possible by careful design and engineering of the complete unit.

All users of machinery equipped with Dust-Stops have the advantages of a quick-change, standard size filter

that can be easily removed when clogged with dirt accumulations and replaced with a new, clean Dust-Stop in a few minutes.

Tocco is but one interesting example of how Dust-Stops can be designed and engineered into machines where dust must be controlled.
