Date : March 20, 1981
Subject : VCM/LEAD DOSIMETRY - SAMPLING FREQUENCIES

The results of 1980 lead and VCM dosimetry are summarized in Tables I & II (Attached).

Based on these results and the probable exposure potentials of the jobs involved, I recommend the sampling scheme shown in Table III be adopted. The following changes in sampling frequencies are involved:

VCM

1. I & E Maintenance Supervisor

Change from yearly to monthly basis because of upper confidence limits (UCL) of results and nature of work.

2. Vinyl Lead Operators & Maintenance Utility Techs

Change from monthly basis to yearly, based on results and nature of work.

3. Plant Manager & Plant Superintendent

Add to monitoring list on yearly basis due to nature of work.

LEAD

1. Dry Blend Utilities & Compound Operators

Change from yearly to monthly basis because of results. Compound Operators to be re-evaluated after June, 1981.

2. Compound Utility

Change from yearly to quarterly basis because of results, especially UCL.

Gerald V. Uptain
Safety Supervisor
