

EPICOTE FINISHES

"Dutch Boy" Epicote Finishes are catalyzed epoxy resin coatings which produce air-dried films possessing many characteristics superior to those of conventional baked finishes. They are highly resistant to water, steam and brine solutions, and to the fumes, splash and spillage of most acids, alkalis and corrosive chemicals.

Epicote Finishes are also highly resistant to fats, oils and greases, and to the action of fuels and solvents. They form hard, flexible, abrasion resistant films that afford maximum protection for buildings, machinery and equipment exposed to corrosive chemical action, abrasion or weathering. Epicote Finishes are not thermoplastic and will withstand dry heat up to 400° F.

EPICOTE PRIMERS

"Dutch Boy" Epicote Primers are formulated for use in combination with Epicote Finishes to afford complete coating systems for a wide range of surface and service conditions.

White Epicote Primer is designed primarily for use as a primer-undercoater on wood surfaces but it is also recommended as an intermediate coat on metal surfaces that have been primed with one of the following metal primers.

Red Strontium Chromate Primer is a highly effective corrosion-inhibitant, formulated for use as a prime coat on aluminum, magnesium or ferrous metal surfaces.

Red Lead Epicote Primer and **Gray Epicote Primer** are designed for use as corrosion-inhibiting primers on ferrous metal surfaces prior to the application of Epicote Finishes.
