

Chemical & Metallurgical Engineering — Vol. 33, No. 12.

UNITED TUBOND*withstands***vibration**

WHEN you install pipe for handling acids, you naturally make sure that it is corrosion-proof—but what about the VIBRATION to which a vertical pipe is subjected in pulsating pumping service? Will cracks develop? The answer is "No" if "United Tubond" pipe is used. Here is lead-lined pipe which is more than merely corrosion-proof. In "United Tubond" the lead is solidly and everlastingly joined to the wrought iron or steel by a special process and this pipe not only withstands vibration but shock and pressure as well.

"UNITED LINED" EQUIPMENT

includes not only "United Tubond" pipe but also lead-lined fittings, valves and tanks. Under the "United" trade mark are also sold hard-lead fittings, valves, cocks and pumps.

"United" installations are now in satisfactory use, eliminating replacements and lasting years where other equipment lasted months in practically every process industry—cellulose, dye-stuffs, explosives, chemicals, tannery, food products, petroleum, rubber, etc., etc. Let us send you actual service reports on installation in your industry.
