On discussion of your recent summary of Aroclor losses and the capital investment involved in stopping same, the Functional Fluids Business Group endorses your suggested alternative. We understand that this includes putting in a settling basin for the existing sewers in the old and new process area at a cost of about \$11,000, including a permanently installed pump. You anticipate that this basin would collect about half of the 50,000 pounds/year estimated loss. After this is achieved, you will have a better fix on the remaining actual losses.

Please let me know when we can anticipate completion of this project.
