Subject: *NEW REPORT* PFAS Regulatory Developments

Dear

With more than 12,000 chemicals in the PFAS class of substances, including a high number associated with health and environmental risks, regulatory authorities have been active in introducing processes that ban or further restrict their use in recent years.

2023 will be no different. Downstream pressure from consumers, retailers and advocacy groups means US state-level regulators have more PFAS regulation in their sights; while in the European Union, plans to restrict the use of PFASs are driving the ongoing debate on essential versus non-essential use.

As the leading global provider of independent intelligence and insight for chemicals management and control, Chemical Watch helps product safety professionals managing chemicals stay up to date on PFAS regulation and the impact on products.

Our award-winning News & Insight team monitors the latest developments, scientific issues and related business updates. So, we are pleased to share our latest members-only report with you.

'PFAS Regulatory Developments: News and insight from around the world' contains sample content from our team and is available now.

PFAS news and insight coverage from around the world

PFASs are widely used in a broad range of consumer and professional products from firefighting foam to food contact materials, cosmetics plus many more. The implications for your compliance efforts are significant.

In this report, find out more about:

- California's 2025 ban on PFAS-containing cosmetics;
- Unep's programme to reduce hazardous chemicals in the textiles industry;
- Japan's new requirements for export of PFOA and decaBDE; and
- how the US EPA has fired a 'warning shot' on the enforcement of PFAS requirements.

Become a free member of Chemical Watch for immediate access to the report.
