gentlemen had to asbestos, it can affect the chromosomes of these cells and cause it to grow in a malignant fashion.

What happens, ladies and gentlemen, with mesothelioma is that this lining that was once there to protect and to ensure that the lung was safe and that you could breathe correctly and saving your abdominal organs, becomes malignant, and as it becomes malignant, it encases the lung, and as it encases the lung, it grows diffusely, and as it grows diffusely, it continues to grow around the lung and encases it to the point where it suffocates the lung and causes an inability to breathe on the part of the individual and actually causes suffocation.

That is what happened in these cases, in Mr. Grewe's case it was a pleural mesothelioma.

It so affected his lung that by May of 1993 over two-thirds of it was gone. It was there, but it was completely encased in a tumor rind, and this one thing that is different is that this material here that I am using is very soft, but the material, the
