Confirming our earlier discussion, after the Fitzgerald/Harbison presentation, quite a bit of time was spent discussing Monsanto's potential obligations in at least being concerned with and possibly coordinating the long-term job of disposal of PCB's current in capacitor/transformer service in the United States. At least two things need to be done rather quickly:

1. Better define for management the role we recommend the corporation play in this problem.
2. Contact Jerry Bratsch in Facilities & Planning so we are knowledgeable about the new St. Louis area incinerator currently being discussed.

I assume you are working on these items. Please let me know when you are in a position to discuss them.
