ABSTRACT

The purpose of this study was to assess the carcinogenicity of the test material, N-Ethyl Perfluorooctanesulfonamido Ethanol (N-EtFOSE), when administered in the diet to rats for at least 104 weeks.

Male and female Crl:CD®(SD)IGS BR rats were assigned to seven groups (70 animals/sex/group for Groups 1, 4, and 5; 60 animals/sex/group for Groups 2 and 3, and 40 animals/sex/group for Groups 6 and 7). Each group received diets containing the vehicle, acetone, (Group 1), or 3 (Group 2), 30 (Group 3), 100 (Groups 4 and 6), or 300 (Groups 5 and 7) ppm N-EtFOSE. Group 6 was placed on recovery after 52 weeks of treatment.

Five animals/sex/group in Groups 1 through 5 were sacrificed during Week 4 and livers were collected. Five animals/sex/group in Groups 1 and 5 were sacrificed during Week 8. Five animal/sex/group in Groups 1 through 4 were sacrificed during Week 14. During Week 52, five animals/sex/group in Group 1 and 10 animals/sex in Group 4 were necropsied. The remaining animals in Groups 1 through 4 were sacrificed at the terminal sacrifice during Week 105. The remaining animals in Group 6 were sacrificed during Week 105 after 52 weeks of recovery. Animals that died on test or were sacrificed at unscheduled intervals were also necropsied, but organ weights were not recorded.

After 7 weeks of treatment at 300 ppm, three males were found dead or sacrificed in a moribund condition. There was a 20% or greater difference in body weights for males and females given 300 ppm compared to the control values. It was decided that 300 ppm exceeded the maximum tolerated dose and Groups 5 and 7 were terminated during Week 8.

An ancillary study was conducted under Covance 6329-228. Seventy animals/sex/group were assigned to two groups, Groups 8 and 9. Animals received diets containing the vehicle, acetone, or 1 ppm N-EtFOSE, respectively. The complete report is presented in Appendix 9, Volume VIII.

Clinical observation, body weight, and food consumption data were recorded. Blood and urine samples were collected for hematology, coagulation, clinical chemistry, urinalysis, and urine chemistry tests at specified time points. Selected organs were weighed at the interim sacrifices during Weeks 8, 14, and 53. Adrenals, brain, eyes, kidneys, liver,

mesenteric lymph nodes, pancreas, spleen, testes, and ovaries from the animals necropsied at the Week 8 and 14 interim sacrifices were examined microscopically. Microscopic examinations were done on tissues from each animal in Groups 1 and 4 sacrificed at the Week 53 interim sacrifice and terminal sacrifice, and any animals that died on test or were sacrificed at unscheduled intervals. Lesions, liver, lungs, kidneys, pancreas, thyroid, testes, mammary glands (females) and urinary bladder from each animal in Groups 2, 3, and 6 sacrificed at the terminal or recovery sacrifices were examined microscopically

Additional liver samples were also collected for evaluation of palmitoyl-CoA oxidase activity and proliferation cell nuclear antigen from five animals/sex/group in Groups 1 through 5 during Week 4, five animals/sex/group in Groups 1 and 5 during Week 8, and five animals/sex/group in Groups 1 through 4 during Week 14.

Liver sections from five animals/sex/group from Groups 1 and 4 were stained with Oil Red "O" and examined microscopically. In addition, liver samples from five animals/sex/group were processed and evaluated by electron microscopy.

Thirty-six control males and 37 control females, 28 males and 37 females given 3 ppm, 28 males and 35 females given 30 ppm, 33 males and 30 females given 100 ppm (Group 4) for 104 weeks, and 30 males and 28 females given 100 ppm for 52 weeks (Group 6) died on test or were sacrificed in a moribund condition. There were no test material-related effects on mortality. The most frequent cause of death was pituitary adenomas.

Clinical observations (thin and hunched appearance, hypoactivity, red discharge from the nose and eyes, few/no/liquid feces, ataxia, squinted eyes, recumbent behavior, and rough/brown/red hair coat) were similar in nature and in the total number of affected animals in all dose groups.

There was a dose-related effect on body weights for males and females given 30 or 100 ppm. After 52 weeks of treatment, mean body weights for males given 3, 30, or 100 ppm were 102, 94, or 88% of control values, respectively. Mean body weights for females given 3, 30, or 100 ppm were 94, 89, or 74% of control values, respectively. After 104 weeks of treatment, mean body weights for males given 3, 30, or 100 ppm were 98, 96, and 87% of control values, respectively. Mean body weights for females

given 3, 30, or 100 ppm were 107, 109, and 82% of control values, respectively. The body weight changes seen at 100 ppm were considered of toxicological significance. Mean cumulative body weight change was statistically significantly lower for males given 30 or 100 ppm diets for Weeks 1 through 15 and 15 through 29. Mean body weight change was statistically significantly lower for females given 30 or 100 ppm for Weeks 1 through 15 and for Weeks 29 to 57 and for females given 100 ppm for Weeks 15 through 29. There was an increase in the rate of body weight gain for Group 6 animals after they were placed on recovery after 52 weeks of treatment.

Mean food consumption for males and females fed the 100 or 300-ppm diets as well as the males fed the 30-ppm diet was generally lower compared with that of the control group, and these values were frequently statistically significantly different from control values. Mean food consumption for males fed the 3-ppm diets and females fed the 3- or 30-ppm diets were comparable to controls with only sporadic differences in mean food consumption noted. The changes seen in food consumption at 100 ppm were considered toxicologically significant and in general correlated with the changes in body weight.

The amount of test material consumed by the animals on a mg/kg of body weight/day basis was as follows.

Group	Target Dose Levels (ppm)	Achieved Dose Levels - Range (mg/kg body weight/day)	
		Males	Females
2	3	0.259 - 0.081	0.109 - 0.307
3	30	0.860 - 2.618	1.029 - 3.070
4	100	3.065 - 8.724	4.213 - 10.166
5/7	300	15.803- 25.408	19.568 - 29.270

Dietary administration of N-EtFOSE for approximately 52 weeks was associated with mildly decreased red blood cell count, hemoglobin, and hematocrit for females given 100 ppm; mildly lower glucose and mildly higher urea nitrogen for males and females given 100 ppm (predominantly at Weeks 14 and 27); moderately higher albumin and moderately lower globulin for males given 100 ppm (predominantly at Weeks 27 and 53); and moderately to markedly lower cholesterol for males given 30 or 100 ppm and females given 100 ppm. The effect on cholesterol was reversed following the 52-week recovery. Administration of N-EtFOSE at 3 ppm for approximately 52 weeks had no effects on clinical pathology test results. Administration of N-EtFOSE for approximately 104 weeks was associated with moderately lower cholesterol for males

given 30 or 100 ppm and moderately lower triglycerides for males and females given 100 ppm.

At a dose level of 300 ppm for approximately 8 weeks, administration of N-EtFOSE was associated with many effects on clinical pathology results including lower red blood cell count, hemoglobin, hematocrit, glucose, globulin, and cholesterol and higher urea nitrogen, albumin, total bilirubin (males only), aspartate aminotransferase (males only), alanine aminotransferase, and hepatic palmitoyl-CoA oxidase (also observed at Week 4). Most of the effects were moderate to marked in magnitude.

The percentage of proliferating hepatocytes (PI) was significantly increased only in males exposed to 300 ppm of N-EtFOSE at 4 weeks on study. This increase was not observed after 8 weeks on study at which time the 300 ppm dose group was removed from the study. The NOEL for hepatocellular proliferation in males was the 100 ppm dose group. Cell proliferation was not statistically significant in females at 4, 8, or 14 weeks on study in any dose group.

At the interim sacrifices, body weights were lower and absolute and relative liver weights were higher for animals given 100 or 300 ppm of the test material.

Macroscopically, diffusely dark livers were only observed for animals given 100 ppm of the test material. Enlargement, mottling, and masses of the liver were slightly more frequent for animals given 100 ppm than for the controls.

Administration of the test material caused an increase in cystic degeneration, hepatocellular hypertrophy, hepatocellular vacuolation, necrosis and hemorrhage of the liver.

At the Week 8 sacrifice, hepatocellular hypertrophy, necrosis and hemorrhage were observed for animals given 300 ppm. Hepatocellular hypertrophy was observed only at the Week 14 sacrifice for animals given 30 or 100 ppm, and hepatocellular vacuolation and hypertrophy were present at the Week 53 sacrifice only for animals given 100 ppm. The hepatic changes were considered toxicologically important.

Test material related hepatic findings for animals given 100 ppm at the terminal sacrifice were cystic degeneration (males only) and hepatocellular hypertrophy and vacuolation.

The incidence of hepatocellular adenomas was slightly higher for males and females given 100 ppm. The higher incidence was statistically significant for females. The only hepatocellular carcinoma in the study was present for a terminal sacrifice female given 100 ppm.

Liver samples were obtained from each of 20 animals (10/sex/group from the control and mid-high dose groups) during necropsy at terminal sacrifice for examination by transmission electron microscopy (TEM). Liver samples were assessed for changes that may likely occur due to chronic toxicity of the test material. Electron microscopic evaluation identified mild to moderate changes related to treatment. Mild to moderate smooth endoplasmic reticulum hyperplasia and minimal to mild hepatocellular hypertrophy were the prominent features found to be different between the mid-high dose group and control animals. Other changes included a slight increase in the amount of lipid accumulation and minor increases in lipofuscin were found in the treated animals compared with controls.

Male and female Crl:CD®(SD)IGS BR rats were administered N-Ethyl Perfluorooctanesulfonamido Ethanol at doses of 0, 3, 30 and 100 ppm at least 104 weeks. There were no significant effects on survival. In males, combined thyroid follicular cell adenoma/carcinoma was significantly increased as compared to controls at 100 ppm ($p = 0.011$) which was due primarily to an increase in follicular cell adenoma ($p = 0.011$). Thyroid follicular cell carcinoma alone was not increased. The relationship of this finding to treatment is questionable for several reasons: thyroid follicular cell tumors in historical controls from this laboratory are relatively common (occur with an incidence of greater than 1%), however, no thyroid follicular cell tumors occurred in male controls from this study, there was no evidence on nonneoplastic lesions of the thyroid, the increase at 100 ppm was within the range of historical controls, and a clear dose-response relationship was not present.

In females, the incidence of combined hepatocellular adenoma/carcinoma was significantly increased in the 100 ppm dose group as compared to controls ($p = 0.007$) as a result of a significant increase in hepatocellular adenoma in this group ($p = 0.012$). There was no increase for trend or pairwise for hepatocellular carcinoma alone. The only hepatocellular carcinoma observed in this study was in a 100-ppm, terminal-sacrifice female. Recovery females in the 100 ppm dose group experienced a marginally significant increase in hepatocellular adenoma ($p = 0.05$). It is noteworthy that , in females, liver effects were only observed at 100 ppm and included the finding of a

hepatocellular adenoma at the Week 53 sacrifice. Significant negative trends and pairwise decreases at 100 ppm occurred among females for mammary tumors (fibroadenoma, combined fibroadenoma/adenoma, and combined fibroadenoma/adenoma/carcinoma). Trends for pituitary adenoma and combined adenoma/carcinoma were also negative in females.

PURPOSE

The purpose of this study was to assess the carcinogenicity of the test material, N-Ethyl Perfluorooctanesulfonamido Ethanol (N-EtFOSE), when administered in the diet to rats for at least 104 weeks.

REGULATORY COMPLIANCE

All aspects of this study were conducted in compliance with the Food and Drug Administration Good Laboratory Practice Regulations as set forth in Title 21 of the United States Code of Federal Regulations, Part 58, issued December 22, 1978 (effective June 20, 1979), and with any applicable amendments.

The protocol was reviewed and approved by the Institutional Animal Care and Use Committee at Covance.

TEST MATERIAL, VEHICLE, AND CARRIER

Test Material

The test material, T-6316 (narrow range N-ethyl perfluorooctanesulfonamido ethanol, N-EtFOSE), a blend of Lot Nos. 30035, 30037, and 30039, is a waxy solid and is 98.1% N-EtFOSE (w/w) (see Protocol Deviations for exceptions). It was received at Covance on June 20 and July 21, 1997.

To avoid repeated heating and sublimation, the two shipments of test material were heated, combined, and predetermined quantities of test material were aliquoted into polyethylene (LDPE) containers. The test material was stored at room temperature.

Information on synthesis methods, stability, composition, or other characteristics that define the test material was provided by the Sponsor and is on file at with the Covance.

Vehicle

The vehicle was acetone (Spectrum Chemical Mfg. Corp., New Brunswick, New Jersey and Gardena, California), Lot Nos. LW0044 (99.96% pure), LH0253 (99.8% pure), and

NS0231 (99.8% pure). The shipments were received at Covance on April 9 and June 23, 1997, and September 8, 1998, respectively. The vehicle was stored at room temperature.

Information on synthesis methods, composition, or other characteristics that define the acetone is on file with the manufacturer.

Carrier

Certified rodent diet (#5002 meal, LabDiet® by Purina Mills, Inc.) was used as supplied. The lot numbers are recorded in the data. The diet is routinely analyzed by the manufacturer for nutritional components and environmental contaminants.

Reserve (Archive) Samples

A reserve sample (5 g) of the test material was taken and stored at room temperature. This sample was transferred to the Sponsor after completion of the inlife phase.

Disposition

The remaining test material was returned to the Sponsor on August 8, 2000.

TEST ANIMALS AND HUSBANDRY

Animals

Male and female Crl:CD®(SD)IGS BR rats were obtained from the Raleigh, North Carolina, facility of Charles River Laboratories on January 6, 1998. At initiation of treatment, the animals were 45 to 51 days old; the males weighed from 202 to 310 g (see Protocol Deviations for exceptions), and the females weighed from 133 to 194 g.

Identification

Each animal was assigned a temporary number upon arrival. Before initiation of treatment, a microchip identification device was implanted into each animal. After randomization for placement on test, each animal was assigned a permanent number, and

the microchip was coded with the permanent number. All data for an animal are recorded under these numbers.

Justification

Historically, rats have been used in safety evaluation studies and are recommended by appropriate regulatory agencies.

Husbandry

Animal Room 3045 was used for this study. Environmental controls for the animal room were set to maintain 18 to 26°C, a relative humidity of 30 to 70%, a 12-hour light/12-hour dark cycle, and a minimum of 10 room air changes/hour.

The animals were housed individually (except for the first 6 days of acclimation when animals were group-housed) in stainless-steel cages. Some animals were placed in polycarbonate cages during the study when health problems dictated.

Certified rodent diet (#5002 meal, LabDiet® by Purina Mills, Inc.) was provided *ad libitum* during acclimation.

Water was provided *ad libitum* (see Protocol Deviations for exceptions). Samples of the water are analyzed for specified microorganisms and environmental contaminants. The results are on file with Covance-Madison.

There were no known contaminants in the diet or water at levels that would have interfered with this study.

Animals not selected for the study (45 males and 41 females) were used for training procedures. Two females were found dead during acclimation.

Acclimation

Four hundred fifty-five males and 453 females were received on January 6, 1998, and acclimated in Animal Room 3045 for 20 days before initiation of treatment. In general, animals in this shipment appeared healthy. During acclimation, the animals were

examined for abnormalities indicative of health problems and body weights were recorded for all animals at randomization.

PROCEDURES

This study was conducted in accordance with the Protocol dated January 21, 1998, and Protocol Amendment Nos. 1 through 8. Protocol deviations are in Appendix 1. An ancillary study, Covance 6329-228, was conducted in accordance with its protocol, April 1, 1998 and Protocol Amendment Nos. 1 through 5. The complete report is presented in Appendix 9.

Group Designations and Dose Levels

The animals used for this study were examined by a laboratory animal veterinarian on January 9, 1998, and found to be suitable for study consideration. Selection of animals for the study was based on acclimation data. Animals were assigned to treatment groups using a computerized blocking procedure designed to achieve body weight balance with respect to treatment group. At the time of randomization, the weight variation of the animals did not exceed ± 2 standard deviations of the mean body weight for each sex. Group mean body weights were analyzed using Levene's test for homogeneity of variance at the 5.0% probability level and found to be homogeneous. Animals were assigned to the study according to the following design.

Group	No. of Animals		Dietary Levels (ppm N-EtFOSE)[a]
	Male	Female	
1 (Control)[b,c,d,e]	70	70	0
2 (Low)[c]	60	60	3
3 (Mid)[c]	60	60	30
4 (Mid-High)[c,e]	70	70	100
5 (High)[c,d]	70	70	300
6 (Mid-High Recovery)[f]	40	40	100
7 (High Recovery)[d]	40	40	300

a T-6316 is 98.1% n-ethyl perfluorooctanesulfonamido ethanol N-EtFOSE); dose levels are expressed as ppm of N-EtFOSE.
b The control animals received the basal diet/acetone only.
c Five animals/sex/group in Groups 1 through 5 were sacrificed during Week 4, and five animals/sex/group in Groups 1 through 4 were sacrificed during Week 14 for hepatocellular proliferation rate measurements and biochemical analyses (palmitoyl-CoA oxidation).
d Five animals/sex/group in Groups 1 and 5 were sacrificed during Week 8; the remaining animals in Groups 5 and 7 were sacrificed and discarded during Week 8.
e Five animals/sex in Group1 and 10 animals/sex in Group 4 were designated as interim sacrifice animals and were sacrificed after at least 52 weeks of treatment.
f Animals in Group 6 were treated for at least 52 weeks, then treatment was discontinued, and the animals were observed for reversibility, persistence, or delayed occurrence of toxic effects for at least 52 weeks posttreatment. During recovery, the animals received basal diet only.

Dosing Procedures

Dose Preparation. Dietary concentrations were based on the test material as supplied. Diets were prepared at least once every 4 weeks.

Preparation of Diet for Group 1. The appropriate amount of certified diet was weighed and mixed with an appropriate volume of acetone.

Preparation of Stock. A stock preparation was made using the required amount of test material dissolved in the required volume of acetone.

Diets for Groups 4/6 and 5/7 (Base Diet). For the 300-ppm base diet, a premix consisting of a portion of the certified diet with the required amount of the stock preparation was mixed using a Hobart® mixer. For the 100-ppm diet, a premix consisting of a portion of the certified diet, the required amount of the stock preparation,

and additional acetone was mixed using a Hobart® mixer. These premixes were transferred to a mixer with additional certified diet and mixed thoroughly.

Diet for Group 2. For the 3-ppm diet, a premix consisting of a portion of the certified diet, the required amount of the prepared 300-ppm diet, and the required volume of acetone, was mixed and then transferred to a mixer with additional certified diet and mixed thoroughly.

Diet for Group 3. For the 30-ppm diet, the required amount of the prepared 300-ppm diet and the required volume of acetone were mixed thoroughly with the appropriate amount of certified feed.

Samples for dose analyses were taken directly from the mixing bowl.

The diets were stored at room temperature (see Protocol Deviations for exceptions) in covered containers until dispensed into feeding jars.

Method of Administration. Dietary admixture was used because the potential route of exposure in humans is oral.

The dose preparations were administered *ad libitum* (see Protocol Deviations for exceptions). Animals in Groups 1 through 4 received the test diet for at least 104 weeks (up to Day 732, Week 105, as applicable). Animals in Group 6 received the test diet for 52 weeks. After 7 weeks of treatment at 300 ppm, three males were found dead or were sacrificed in a moribund condition. There was a 20% or greater difference in body weights for males and females given 300 ppm compared to control values. It was decided that 300 ppm exceeded the maximum-tolerated dose and Groups 5 and 7 were terminated during Week 8.

Retention Samples. Samples (approximately 100 g) were taken from each dose preparation and stored at room temperature (see Protocol Deviations for exceptions). Unless used for analyses, retention samples from the treated groups were discarded at least 1 month after completion of the inlife phase (see Protocol Deviations for exceptions). Samples from the control diets prepared for Weeks 1 through 24 were shipped to the Sponsor.

Dose Analysis

Analyses for the concentration of test material in the dose preparations were done by Covance using an analytical method, MP-M312-MA, validated by Covance.

Homogeneity was determined for all concentrations once pretest and for preparations for Weeks 1 through 3; for two additional pretest high-dose level preparations; and for four additional pretest low-dose level preparations. One sample (approximately 100 g) taken from the top, middle, and bottom of the mix were collected, divided into three subsamples for extraction and analysis (see Protocol Deviations for exceptions), and analyzed for test material content. All samples were stored at room temperature.

To evaluate the stability of the test material in the carrier, four sets of samples (approximately 100 g each) were taken from the low- and high-dose level concentrations of diet preparations mixed pretest. One set was analyzed on the day of mixing; one set was analyzed after storage at room temperature for 19 days; one set was analyzed after storage at room temperature for 34 days; and the remaining set was analyzed after being stored for 8 weeks in a freezer set to maintain -10 to -30°C. In addition, samples (approximately 100 g each) were taken from the low- and high-dose level concentrations of diet preparations mixed pretest. The samples were stored at room temperature for 5 days, then for 7 days under animal room conditions (room temperature in a feeding container), then analyzed.

For dose confirmation, samples (approximately 100 g each) from all dose preparations were analyzed in duplicate. Homogeneity samples collected from the middle of the dose preparations for Weeks 1 through 3 were used for dose confirmation results. All samples were stored at room temperature until analyzed.

Observation of Animals

Clinical Observations. The animals were observed twice daily (a.m. and p.m.) for mortality and moribundity (see Protocol Deviations for exceptions). Once prior to treatment and weekly thereafter, each animal was removed from its cage and examined; abnormal findings or an indication of normal were recorded (see Protocol Deviations for exceptions). In addition, the time of onset, location, size, appearance, and progression of each grossly visible or palpable mass were recorded.

Body Weights. Individual body weight data were recorded on Day -4 (randomization), weekly for Weeks 1 through 17, once every 4 weeks thereafter, and at Week 105 (see Protocol Deviations for exceptions). Body weights were also recorded for animals in Groups 5 and 7 before sacrifice during Week 8.

Food Consumption. Individual food consumption data were recorded weekly for Weeks 1 through 16 and once every 4 weeks thereafter (see Protocol Deviations for exceptions).

Clinical Pathology

Blood and urine samples were collected from five animals/sex/group from Groups 1 and 5 during Week 8 and from 10 animals/sex/group from Groups 1 through 4 during Weeks 14, 27, and 53. Blood films were made and held for possible future examination from animals sacrificed at unscheduled intervals and from animals at scheduled sacrifices after at least 52 and 104 weeks of treatment (see Protocol Deviations for exceptions). In addition, blood was collected for cholesterol and triglycerides tests only from all remaining animals at the terminal and recovery sacrifices.

Animals were fasted overnight, and urine was collected chilled for approximately 16 hours before blood sampling; water was provided *ad libitum*. Blood was collected from a jugular vein. The anticoagulant was potassium EDTA for the hematology tests. Samples for clinical chemistry and serum samples were collected without anticoagulant. Animals were bled in random order. The following were evaluated.

Hematology

- red blood cell (erythrocyte) count
- hemoglobin
- hematocrit
- mean corpuscular volume
- mean corpuscular hemoglobin
- mean corpuscular hemoglobin concentration
- platelet count
- white blood cell (leukocyte) count
- differential blood cell count
  - segmented neutrophil count
  - lymphocyte count
  - monocyte count
  - eosinophil count
  - basophil count
- blood cell morphology

Reticulocyte smears were made and held for possible future examination.

Clinical Chemistry

glucose	alanine aminotransferase
urea nitrogen	gamma glutamyltransferase
creatinine	aspartate aminotransferase
total protein	calcium
albumin	inorganic phosphorus
globulin	sodium
cholesterol	potassium
total bilirubin	chloride

Urinalysis

appearance	glucose
volume	ketones
specific gravity	bilirubin
pH	blood
protein	microscopic examination of sediment
urobilogen	

Urine Chemistry

sodium	16-hour excretion of:
potassium	sodium
	potassium

Serum samples not used for clinical chemistry were stored in a freezer set to maintain -60 to -80°C. Samples were shipped on dry ice to the Sponsor for possible future analysis.

Serum Analyses

Blood [approximately 2 mL at the Week 4, 8, and 14 sacrifices and approximately 3 mL at the Week 53 and 105 sacrifices (see Protocol Deviations for exceptions)] was collected. Samples were collected from five animals/sex/group in Groups 1 through 5 during Week 4 (animals selected for hepatocellular proliferation and biochemical analyses); five animals/sex/group in Groups 1 and 5 during Week 8; five animals/sex/group in Groups 1 through 4 during Week 14 (animals selected for hepatocellular proliferation and biochemical analyses); five animals/sex/group from Groups 1 and 4 (from animals selected for interim sacrifice) after at least 52 weeks of treatment; and all remaining animals at terminal and recovery sacrifices.

Animals were fasted overnight and blood was collected without anticoagulant from a jugular vein. Blood samples were allowed to clot at room temperature, then centrifuged. Serum samples were harvested and stored in a freezer set to maintain -60 to -80°C. Samples were shipped on dry ice to the Sponsor for possible future analyses.

Anatomic Pathology

Necropsy. A necropsy was done on each animal that died or was sacrificed at an unscheduled interval. Animals sacrificed before Week 13 were anesthetized with sodium pentobarbital and animals sacrificed during or after Week 13 were anesthetized with carbon dioxide (see Protocol Deviations for exceptions).

During Week 4, five animals/sex/group from Groups 1 through 5 were fasted overnight, anesthetized with sodium pentobarbital, weighed, and exsanguinated. The liver was removed and weighed. Representative samples of left lateral, right median, and right lateral lobes and any macroscopic lesions of the liver were collected and preserved in zinc formalin for proliferation cell nuclear antigen (PCNA). Liver samples were also collected for palmitoyl CoA analysis. A sample (approximately 1.5 g) from the remaining portion of the liver was collected from selected animals. Samples were placed on wet ice and transferred to the Sponsor for mitochondrial analysis. Results will not be included in this report. Additional liver samples were stored in a freezer, set to maintain -60 to -80°C, and sent to the Sponsor for possible future analysis.

During Week 8, five animals/sex/group from Groups 1 and 5 were fasted overnight, bled for clinical pathology and serum analyses, anesthetized with sodium pentobarbital, weighed, exsanguinated, and necropsied. Liver samples were collected for palmitoyl CoA analysis and PCNA evaluation. Additional liver samples were stored in a freezer, set to maintain -60 to -80°C, and shipped to the Sponsor for possible future analysis. The remaining animals in Groups 5 and 7 were euthanatized with carbon dioxide and the carcasses discarded without necropsy.

During Week 14, five animals/sex/group from Groups 1 through 4 were fasted overnight, bled for clinical pathology and serum analyses, anesthetized with carbon dioxide, weighed, exsanguinated, and necropsied. Liver samples were collected for palmitoyl CoA analysis and PCNA evaluation. Additional liver samples were stored in a freezer, set to maintain -60 to -80°C, and shipped to the Sponsor for possible future analysis.

After at least 52 weeks of treatment, 5 animals/sex from Group 1 and 10 animals/sex from Group 4 were fasted overnight, anesthetized with carbon dioxide, weighed, exsanguinated, and necropsied. Additional liver samples were stored in a freezer, set to maintain -60 to -80°C, and shipped to the Sponsor for possible future analysis.

After 104 weeks of treatment, the remaining animals in Groups 1 through 4 were fasted overnight, then anesthetized with carbon dioxide, weighed, exsanguinated, and necropsied. Additional liver samples were stored in a freezer, set to maintain -60 to -80°C, and shipped to the Sponsor for possible future analysis.

After 52 weeks of treatment and 52 weeks without treatment, the remaining animals in Group 6 were fasted overnight, then anesthetized with carbon dioxide, weighed, exsanguinated, and necropsied. Additional liver samples were stored in a freezer, set to maintain -60 to -80°C, and shipped to the Sponsor for possible future analysis.

The necropsy included a macroscopic examination of the external features of the carcass; external body orifices; the abdominal, thoracic, and cranial cavities; organs; and tissues.

Proliferation Cell Nuclear Antigen Evaluation

Liver samples were collected from five animals/sex/group in Groups 1 through 5 during Weeks 4 and 8 and five animals/sex/group in Groups 1 through 4 during Week 14.

At the Week 4 collection, representative samples of left lateral, right median, and right lateral lobes of the liver and macroscopic lesions of the liver were collected and preserved in zinc formalin. At the Week 8 and 14 collections, representative samples of the left lateral lobe and any macroscopic lesions of the liver were collected and preserved in zinc formalin. After fixation, each sample of the liver was embedded in paraffin, and the paraffin blocks were shipped to Pathology Associates International. Proliferation cell nuclear antigen (PCNA) evaluation were done on the samples (left lateral lobe only). In addition, sections of the left lateral lobe of the liver were stained with hematoxylin and eosin and examined microscopically.

Palmitoyl-CoA Oxidase Tissue Collection and Analyses

Liver samples were collected from five animals/sex/group in Groups 1 through 5 during Week 4; five animals/sex/group in Groups 1 through 5 during Week 8; and five animals/sex/group in Groups 1 through 4 during Week 14.

A sample (approximately 500 mg) of the right lateral lobe of the liver was also collected from each animal and flash-frozen in liquid nitrogen (see Protocol Deviations for exceptions). The liver tissue was stored in a freezer, set to maintain -60 to -80°C, until analyzed for palmitoyl CoA oxidase activity.

Organ Weights. At the interim sacrifices during Weeks 8, 14, and 53, the following organs (when present) were weighed; paired organs were weighed separately (see Protocol Deviations for exceptions).

adrenal (2)
brain
kidney (2)
liver
lung
ovary (2)
spleen
testis (2)
thyroid (2) with parathyroid
uterus with cervix

Organ-to-body weight percentages and organ-to-brain weight ratios were calculated.

Tissue Preservation. The following tissues were collected and preserved in 10% neutral-buffered formalin (see Protocol Deviations for exceptions).

adrenal (2)
brain
cecum
cervix
colon
duodenum
epididymis (2)
esophagus
eye (2)
femur with bone marrow (articular surface of the distal end)
Harderian gland
heart
ileum
jejunum
kidney (2)
lesions
liver
lung with mainstem bronchi
lymph node (mesenteric)
mammary gland (females only)
ovary (2)
pancreas
pituitary
prostate
rectum
salivary gland [mandibular (2)]
sciatic nerve

seminal vesicle (2)
skeletal muscle (thigh)
skin
spinal cord (cervical, thoracic, and lumbar)
spleen
sternum with bone marrow
stomach
testis (2)
thymus
thyroid (2) with parathyroid
trachea
urinary bladder
uterus
vagina

Bone marrow smears from the femur of each animal at scheduled sacrifices were prepared, stained with Wright's stain, and retained for possible examination.

In addition, at the terminal and recovery sacrifices, a section of the heart and liver were collected from 10 animals/sex in Groups 1, 3, 4 (terminal sacrifice), and 6 (recovery sacrifice) and preserved in 2.0% paraformaldehyde/2.5% glutaraldehyde in 0.1M phosphate buffer. The tissues were processed and embedded in epoxy blocks for possible future examination by electron microscopy.

Histopathology. Tissues (as appropriate) were embedded in paraffin, sectioned, stained with hematoxylin and eosin, and examined microscopically from each animal in Groups 1 and 4 sacrificed at the terminal sacrifice and any animals that died on test or were sacrificed at unscheduled intervals.

Tissues (as appropriate) from each animal in Groups 1 and 4 sacrificed at the Week 53 interim sacrifice were embedded in paraffin, sectioned, stained with hematoxylin and eosin, and examined microscopically.

Lesions, liver, lungs, kidneys, pancreas, thyroid, testes, mammary glands (females), and urinary bladder from each animal in Groups 2, 3, and 6 sacrificed at the terminal or recovery sacrifices were embedded in paraffin, sectioned, stained with hematoxylin and eosin, and examined microscopically.

Adrenals, brain, eyes, kidneys, liver, mesenteric lymph nodes, pancreas, spleen, testes, and ovaries from the animals necropsied at the Week 8 and 14 interim sacrifices were also embedded in paraffin, sectioned, stained with hematoxylin and eosin, and examined microscopically.

A pathology peer review was conducted by a pathologist designated by the sponsor.

Liver sections from five animals/sex/group from Groups 1 and 4 were stained with Oil Red "O" stain and examined microscopically.

Liver sections in epoxy blocks for five animals/sex/group from Groups 1 and 4 were processed and evaluated by electron microscopy by Pathology Associates International (report included in Appendix 8).

Statistical Evaluation

Levene's test (Levene, 1960) was done to test for variance homogeneity. In the case of heterogeneity of variance at $p \leq 0.05$, transformations were used to stabilize the variance.

One-way analysis of variance [ANOVA (Winer, 1971)] was used to analyze initial body weights, body weight changes, food consumption, continuous clinical pathology values, and organ weight data.

ANOVA was done on the homogeneous or transformed data. If the ANOVA was significant, Dunnett's t-test (Dunnett, 1964) was used for pairwise comparisons between treated and control groups.

Group comparisons were evaluated at the 5.0%, two-tailed probability level. Only data collected on or after the first day of treatment were analyzed statistically.

Survival and Tumor Analysis

Survival. Evaluations of trend and heterogeneity of survival data were performed using the Cox-Tarone binary regression method and the National Cancer Institute (NCI) Life Table Package (Thomas, Breslow, and Gart, 1977). Week 105 was treated as the end of the study in the NCI package for both sexes. Animals that died accidentally and those that were sacrificed at scheduled intervals were censored in the analysis. Continuity corrected one-sided tail probabilities for trend and two-sided tail probabilities for group comparisons were evaluated at the 5.0% significance level.

Nonneoplastic Lesions. Nonneoplastic lesions were chosen for statistical analyses if the incidence rate in at least one treated group was increased or decreased by at least two occurrences over the control group. These were analyzed by the Cochran-Armitage test for trend and the Fisher-Irwin exact test for control versus treatment comparisons

(Thakur, Berry, and Mielke, 1985). One-sided tail probabilities for trend and group comparisons were evaluated at the 5.0% significance level.

Neoplastic Lesions. Neoplastic lesions were chosen for statistical analyses if the incidence rate in at least one treated group was increased or decreased by at least two occurrences over the control group. The incidental tumors (i.e., tumors that were not assigned to be the cause of death of the animals by the study pathologist) were analyzed by logistic regression of tumor prevalence (Dinse and Lagakos, 1983). The logistic regression model included linear and quadratic terms in age (week of death), but the quadratic term was eliminated if there was a lack of convergence. The fatal and palpable (superficial) tumors were analyzed by Cox-Tarone binary regression method, as in the case of survival, using the death time or the first palpation time (as applicable) as the tumor onset time. In the case of any particular tumor type where the study pathologist assigned the tumor in question as being the cause of death of a subset of the animals and the rest of the animals were assumed to be dead of other competing risks, IARC-type (Peto, et al., 1980) cause of death analysis was performed. Specifically, the subset of the tumors, which were assigned to be the cause of death by the examining pathologist, was analyzed by Cox-Tarone logistic regression under life table techniques. The subset, which was considered incidental by the pathologist, was analyzed by logistic regression of tumor prevalences. For the cases of tumor types where cause of death was undetermined, these were treated as incidental for statistical evaluation. The score statistics and their respective variances from the above tests were then used to compute the combined evidence as described by Gart, et al., (1986). In the case of only one tumor belonging to one of the two categories (fatal and incidental) in a test, it was combined with the other category for the purpose of statistical analyses. In addition, in cases where there was lack of convergence for the asymptotic test of the logistic regression method, the exact probability of the test was obtained by using LogXact-Turbo (1993) and combined with the probability of the Cox-Tarone test, if necessary.

Common and rare tumors were evaluated at the 1.0% and 5.0% significance levels, respectively, for trend. The benign and malignant neoplastic incidences were evaluated separately, but were combined where appropriate. The criteria for combination were based on the work of McConnell et al. (1986). The incidences of multiple-organ findings such as hemangioma, hemangiosarcoma, lipoma, liposarcoma, fibroma, fibrosarcoma, leiomyoma, leiomyosarcoma, endometrial stromal polyp, and endometrial stromal sarcoma were counted by animal, not by tissue type. They were evaluated statistically if they met the selection criterion for the analysis. The statistical results for these cases may

be biased because not all the animals were examined for every tissue. Pairwise one-sided group comparisons were evaluated at the 5.0% significance level.

Groups 5 (High-dose) and 7 (High recovery) were excluded from all the analyses except the survival graphs due to early sacrifices at Week 8. In the nonneoplastic analyses, animals sacrificed early (Week 4) in Groups 1 through 4 (Control, Low, Mid, and Mid-High, respectively) were excluded from the denominators. In the statistical evaluations of the neoplastic lesions, animals sacrificed early (during or before Week 14) in Groups 1 through 4 were discounted from the number of animals at risk. Further, in the neoplastic analyses, in the cases where the low, mid, and mid-high recovery groups did not have a complete histopathology examination, they were excluded from statistical analyses.

The p-values under Group 1 (Control) are for trend analysis and the p-values under Groups 2 (Low), 3 (Mid), 4 (Mid-High), and 6 (Mid-High recovery) are for the comparison of that group versus the control group. Group 6 was also compared with Group 4. Trend analysis includes Groups 1, 2, 3, and 4 only.

Ordinal dose levels 0, 1, 2, and 3 were used in all analyses for Groups 1, 2, 3, and 4, respectively. Continuity correction was done for all asymptotic tests. The following notations are used throughout this report to designate direction and significance of effects.

+	=	Effect in the increased direction
-	=	Effect in the decreased direction
*	=	Significant at $p \leq 0.05$
**	=	Significant at $p \leq 0.01$
E	=	Exact permutation test
NA	=	Not analyzed

Record Retention

The raw data, documentation, records, specimens, protocol, and final report generated as a result of this study will be archived in the storage facilities of Covance-Madison. At least 1 year after submission of the final report, the Covance Archives staff will contact the Sponsor. At that time, the Sponsor may choose to have the aforementioned materials returned, archived for an additional period of time, or disposed of by Covance; a fee will

be charged based on the archive disposition option selected by the Sponsor. Raw data stored on magnetic media and the protocol, study correspondence, and the original final report will be retained by Covance. At least 1 year after submission of the final report, any frozen samples will be returned to the Sponsor, retained by Covance, or disposed of, and a fee will be charged. Data generated by the Sponsor will be archived in the Sponsor's storage facilities. Specimens, data, and reports for PCNA evaluation and electron microscopy will be retained by Pathology Associates International. Frozen liver samples and serum samples sent to the Sponsor will be retained by the Sponsor.

RESULTS AND DISCUSSION

Dose Analysis

Results of the homogeneity, stability, and dose preparation analyses are in Tables 1 through 3.

Prestudy (September 11, 29, October 15, and November 7 and 13, 1997), several homogeneity analyses were conducted on each of several mixes in an attempt to resolve issues related to the inherent variability and lack of sufficient sensitivity at low levels in the analytical method for measuring N-EtFOSE. Mean values of the homogeneity analyses for the mix done on January 15, 1998, ranged from 89.7-104%, 92.0-98.7%, 86.8-98.4%, and 94.0-96.7% of the theoretical concentrations for the diets containing 3, 30, 100, or 300 ppm N-EtFOSE, respectively. Mean values of an additional homogeneity analyses for the mix done on August 26, 1999, ranged from 66.2 to 72.7% and 121 to 136% of the theoretical concentrations for the diets containing 100 or 300 ppm, respectively.

Prestudy (September 11 and 29, 1997), several stability analyses were conducted on each of several mixes in an attempt to resolve the issues related to the inherent variability and lack of sufficient sensitivity at low levels in the analytical method for measuring N EtFOSE. Results of the stability analyses for the mix conducted on October 15, 1997, of samples stored for 19 days at room temperature conditions indicated that the mean concentrations were 99.3 and 86.7% of the theoretical concentrations of 3 and 300 ppm, respectively. Results of the stability analyses for the mix conducted on October 15, 1997, of samples stored for 34 days at room temperature conditions indicated that the mean concentrations were 100 and 88.7% of the theoretical concentrations of 3 and 300 ppm, respectively. Results of stability analyses for the mix conducted on October 15, 1997, of

samples stored for 8 weeks under frozen conditions indicated that the mean concentrations were 99.0 and 94.3% of the theoretical concentrations of 3 and 300 ppm, respectively. Results of the stability analyses for an additional mix conducted November 13, 1997, of samples stored 5 days at room temperature followed by 7 days under animal room conditions indicated that the mean concentrations were 118 and 87.7% of the theoretical concentrations of 3 and 300 ppm, respectively.

The mean concentrations of the dose preparation analyses for all levels ranged from 33.3 to 158% of the theoretical concentrations (including the reassay and retention sample analyses, but excluding data that required reanalysis.). Inherent variability and lack of sufficient sensitivity at low levels in the analytical method for measuring N-EtFOSE resulted in homogeneity, stability, and routine analyses data that were in many cases outside of the standard limits of $\pm$15%.

Observation of Animals

Survival and Clinical Observations. Clinical observations including mass observations are summarized in Tables 5 and 6; individual data are in Appendix 2. Survival data are illustrated in Figures 1 and 2 and summarized in Table 4; individual animal fate data are in Appendix 2.

Thirty-six control males and 37 control females, 28 males and 37 females given 3 ppm, 28 males and 35 females given 30 ppm, 33 males and 30 females given 100 ppm for 104 weeks (Group 4) and 30 males and 28 females given 100 ppm for 52 weeks (Group 6) died on test or were sacrificed in a moribund condition. There were no test material-related effects on mortality. The most frequent cause of death was pituitary adenoma.

Clinical observations were similar in nature and in the total number of affected animals in all groups.

Body Weights. Body weight and body weight change data are illustrated in Figures 3 and 4 and summarized in Tables 7 and 8; individual body weight data are in Appendix 3.

There was a dose-related decrease on body weights for males and females given 30 or 100 ppm. Mean cumulative body weight change was statistically significantly lower for males given 30 or 100 ppm diets for Weeks 1 through 15 and 15 through 29. Mean body

weight change was statistically significantly lower for females given 30 or 100 ppm for Weeks 1 through 15 and for Weeks 29 to 57 and for females given 100 ppm for Weeks 15 through 29. There was an increase in the rate of body weight gain for Group 6 animals after they were placed on recovery after 52 weeks of treatment.

Food Consumption. Food consumption data are illustrated in Figures 5 and 6 and summarized in Table 9; individual data are in Appendix 4.

Mean food consumption for males and females fed the 100- or 300-ppm diets as well as the males fed the 30-ppm diet was generally lower compared with that of the control group, and these values were frequently statistically significantly different from control values. Mean food consumption for males fed the 3-ppm diets and females fed the 3- or 30-ppm diets were comparable to controls with only sporadic differences in mean food consumption noted.

Test Material Consumption. Test material consumption data are summarized in Table 10. Individual test material consumption data are presented in Appendix 4.

Animals were fed diets containing 3, 30, 100, or 300 ppm N-EtFOSE The amount of test material consumed by the animals on a mg/kg of body weight/day basis was as follows.

Group	Target Dose Levels (ppm)	Achieved Dose Levels - Range (mg/kg body weight/day)	
		Males	Females
2	3	0.259 - 0.081	0.109 - 0.307
3	30	0.860 - 2.618	1.029 - 3.070
4	100	3.065 - 8.724	4.213 - 10.166
5/7	300	15.803- 25.408	19.568 - 29.270

Clinical Pathology

Hematology, coagulation, clinical chemistry, urinalysis, and urine chemistry data are summarized in Tables 11 through 28; individual data are in Appendix 5. The Pathology Report contains a discussion of the data.

Dietary administration of N-EtFOSE for approximately 52 weeks was associated with mildly decreased red blood cell count, hemoglobin, and hematocrit for females given 100 ppm; mildly lower glucose and mildly higher urea nitrogen for males and females

given 100 ppm (predominantly at Weeks 14 and 27); moderately higher albumin and moderately lower globulin for males given 100 ppm (predominantly at Weeks 27 and 53); and moderately to markedly lower cholesterol for males given 30 or 100 ppm and females given 100 ppm. The effect on cholesterol was reversed following the 52-week recovery. Administration of N-EtFOSE at 3 ppm for approximately 52 weeks had no effects on clinical pathology test results. Administration of N-EtFOSE for approximately 104 weeks was associated with moderately lower cholesterol for males given 30 or 100 ppm and moderately lower triglycerides for males and females given 100 ppm.

At a dose level of 300 ppm for approximately 8 weeks, administration of N-EtFOSE was associated with many effects on clinical pathology results including lower red blood cell count, hemoglobin, hematocrit, glucose, globulin, and cholesterol and higher urea nitrogen, albumin, total bilirubin (males only), aspartate aminotransferase (males only), alanine aminotransferase, and hepatic palmitoyl-CoA oxidase (also observed at Week 4). Most of the effects were moderate to marked in magnitude.

Anatomic Pathology

Organ weight data are summarized in Tables 29 through 32; incidences of macroscopic and microscopic observations are summarized in Tables 33 through 45; the incidence of severity of selected microscopic observations is summarized in Tables 46 through 51. Individual data are in Appendix 6. The Pathology Report contains a discussion of the data.

At the interim sacrifices, body weights were lower and absolute and relative liver weights were higher for animals given 100 or 300 ppm of the test material.

Macroscopically, diffusely dark livers were only observed for animals given 100 ppm of the test material. Enlargement, mottling, and masses of the liver were slightly more frequent for animals given 100 ppm than for the controls.

Administration of the test material caused an increase in cystic degeneration, hepatocellular hypertrophy, hepatocellular vacuolation, necrosis and hemorrhage of the liver.

At the Week 8 sacrifice, hepatocellular hypertrophy, necrosis and hemorrhage were observed for animals given 300 ppm. Hepatocellular hypertrophy was observed only at the Week 14 sacrifice for animals given 30 or 100 ppm, and hepatocellular vacuolation and hypertrophy were present at the Week 53 sacrifice only for animals given 100 ppm. The hepatic changes were considered toxicologically important.

In males, combined thyroid follicular cell adenoma/carcinoma was significantly increased as compared to controls at 100 ppm ($p = 0.011$) which was due primarily to an increase in follicular cell adenoma ($p = 0.011$). Thyroid follicular cell carcinoma alone was not increased. The relationship of this finding to treatment is questionable for several reasons: thyroid follicular cell tumors in historical controls from this laboratory are relatively common (occur with an incidence of greater than 1%), however, no thyroid follicular cell tumors occurred in male controls from this study, there was no evidence on nonneoplastic lesions of the thyroid, the increase at 100 ppm was within the range of historical controls, and a clear dose-response relationship was not present.

In females, the incidence of combined hepatocellular adenoma/carcinoma was significantly increased in the 100 ppm dose group as compared to controls ($p = 0.007$) as a result of a significant increase in hepatocellular adenoma in this group ($p = 0.012$). There was no increase for trend or pairwise for hepatocellular carcinoma alone. The only hepatocellular carcinoma observed in this study was in a 100-ppm, terminal-sacrifice female. Recovery females in the 100 ppm dose group experienced a marginally significant increase in hepatocellular adenoma ($p = 0.05$). It is noteworthy that , in females, liver effects were only observed at 100 ppm and included the finding of a hepatocellular adenoma at the Week 53 sacrifice. Significant negative trends and pairwise decreases at 100 ppm occurred among females for mammary tumors (fibroadenoma, combined fibroadenoma/adenoma, and combined fibroadenoma/adenoma/carcinoma). Trends for pituitary adenoma and combined adenoma/carcinoma were also negative in females.

Proliferation Cell Nuclear Antigen Results

A statistically significant increase in proliferative index was observed transiently in males of the 300 ppm dose group at Week 4, but not at Week 8 or in any other male dose groups. Biological significance for an individual animal is defined as a two-fold or greater increase in proliferative index (PI) over the averaged control values, and the PI must be greater than the highest control value. Biologically significant increases in PI

were observed in one out of five males of the 100 ppm dose group at Week 4, however, these increases were not sustained through Week 8. Biologically significant increases in PI were observed in two out of five males at Week 4 and in two out of five males in the 300 ppm dose group at Week 8. No increase in hepatocellular proliferation was observed at Week 14 in the male 100 ppm dose group. The NOEL for hepatocellular proliferation in males was the 100 ppm dose group. Cell proliferation was not statistically or biologically significant in females at 4, 8, or 14 weeks on study in any dose group. The NOEL for hepatocellular proliferation in females was the 300 ppm dose group.

Electron Microscopy Results

Liver samples were obtained from each of 20 animals (10 animals/sex/group from the control and mid-high dose groups) during necropsy at terminal sacrifice for examination by transmission electron microscopy (TEM). Liver samples were assessed for changes that may likely occur due to chronic toxicity of the test material. Electron microscopic evaluation identified mild to moderate changes related to treatment. Mild to moderate smooth endoplasmic reticulum hyperplasia and minimal to mild hepatocellular hypertrophy were the prominent features found to be different between the mid-high dose group and control animals. Other changes included a slight increase in the amount of lipid accumulation and minor increases in lipofuscin were found in the treated animals compared with controls.

CONCLUSION

Male and female Crl:CD®(SD)IGS BR rats were administered N-Ethyl Perfluorooctanesulfonamido Ethanol at doses of 0, 3, 30 and 100 ppm at least 104 weeks. There were no significant effects on survival, and the incidence of hepatocellular adenomas was slightly higher for males and females given 100 ppm. The only hepatocellular carcinoma in the study was present for a terminal sacrifice female given 100 ppm.

PATHOLOGY REPORT

SUMMARY

The purpose of this study was to assess the carcinogenicity of the test material, N-Ethyl Perfluorooctanesulfonamido Ethanol (N-EtFOSE), when administered in the diet to rats for at least 104 weeks. The test material was administered at dose levels of 0, 3, 30, 100, and 300 ppm. Animals given 300 ppm were sacrificed during Week 8.

Dietary administration of N-EtFOSE for approximately 52 weeks was associated with mildly decreased red blood cell count, hemoglobin, and hematocrit for females given 100 ppm; mildly lower glucose and mildly higher urea nitrogen for males and females given 100 ppm (predominantly at Weeks 14 and 27); moderately higher albumin and moderately lower globulin for males given 100 ppm (predominantly at Weeks 27 and 53); and moderately to markedly lower cholesterol for males given 30 or 100 ppm and females given 100 ppm. The effect on cholesterol was reversed following the 52-week recovery. Administration of N-EtFOSE at 3 ppm for approximately 52 weeks had no effects on clinical pathology test results. Administration of N-EtFOSE for approximately 104 weeks was associated with moderately lower cholesterol for males given 30 or 100 ppm and moderately lower triglycerides for males and females given 100 ppm.

At a dose level of 300 ppm for approximately 8 weeks, administration of N-EtFOSE was associated with many effects on clinical pathology results including lower red blood cell count, hemoglobin, hematocrit, glucose, globulin, and cholesterol and higher urea nitrogen, albumin, total bilirubin (males only), aspartate aminotransferase (males only), alanine aminotransferase, and hepatic palmitoyl-CoA oxidase (also observed at Week 4). Most of the effects were moderate to marked in magnitude.

At the interim sacrifices, body weights were lower and absolute and relative liver weights were higher for animals given 100 or 300 ppm of the test material.

Macroscopically, diffusely dark livers were only observed for animals given 100 ppm of the test material. Enlargement, mottling, and masses of the liver were slightly more frequent for animals given 100 ppm than for the controls.

Administration of the test material caused an increase in cystic degeneration, hepatocellular hypertrophy, hepatocellular vacuolation, necrosis and hemorrhage of the liver.

At the Week 8 sacrifice, hepatocellular hypertrophy, necrosis and hemorrhage were observed for animals given 300 ppm. Hepatocellular hypertrophy was observed only at the Week 14 sacrifice for animals given 30 or 100 ppm, and hepatocellular vacuolation and hypertrophy were present at the Week 53 sacrifice only for animals given 100 ppm. The hepatic changes were considered toxicologically important.

Test material related hepatic findings for animals given 100 ppm at the terminal sacrifice were cystic degeneration (males only) and hepatocellular hypertrophy and vacuolation.

The incidence of hepatocellular adenomas was slightly higher for males and females given 100 ppm. The higher incidence was statistically significant for females. The only hepatocellular carcinoma in the study was present for a terminal sacrifice female given 100 ppm. The incidence of hepatocellular adenomas and carcinomas is listed in Text Table 2.

METHODS

Seven groups of Crl:CD®(SD)IGS BR rats were studied using the following study design.

Group	No. of Animals		Dietary Levels [a] (ppm N-EtFOSE)
	Male	Female	
1 (Control) [b]	70	70	0
2 (Low)	60	60	3
3 (Mid)	60	60	30
4 (Mid-High)	70	70	100
5 (High)[c]	70	70	300
6 (Mid-High Recovery)	40	40	100
7 (High Recovery)[c]	40	40	300
8	70	70	0
9	70	70	1

a T-6316 is 98.1% n-ethyl perfluorooctanesulfonamido ethanol (N-etFOSE); dose levels are expressed as ppm of N-EtFOSE.
b The control animals received the basal diet only.
c Five animals/sex in Group 5 were sacrificed during Week 8; the remaining animals in Groups 5 and 7 were sacrificed and discarded during Week 8.

During Week 8, blood and urine were collected for hematology, clinical chemistry, urinalysis, and urine chemistry tests from five animals/sex/group in Groups 1 and 5. During Weeks 14, 27, and 53, blood and urine were collected for these tests from 10 animals/sex/group in Groups 1 through 4. Blood smears were made for all animals sacrificed at unscheduled intervals or during Weeks 53 (interim sacrifice) and 105 (terminal and recovery sacrifices). During Week 105, blood was collected for cholesterol and triglycerides from all surviving animals.

Necropsies were performed on five animals/sex in Groups 1 and 5 sacrificed during Week 8; five animals/sex in Groups 1 through 4 sacrificed during Week 14, five animals/sex in Group 1 and 10 animals/sex in Group 4 sacrificed during Week 53, and all remaining surviving animals during Week 105. At necropsy, macroscopic observations were recorded, organ weights were obtained (for sacrifices during Weeks 8, 14, and 53), and tissues were placed in fixative as specified by the protocol. At unscheduled necropsies for animals that died or were sacrificed because of poor health, macroscopic observations were recorded, and tissues were placed in fixative, but organ weights were not obtained. Microscopic examinations were done on selected tissues from animals in Groups 1 through 5 necropsied during Weeks 8 and 14. The tissues were adrenals, brain, eyes, kidneys, liver, mesenteric lymph node, pancreas, spleen, testes, and ovaries. Microscopic examinations were done on all collected tissues from animals in Groups 1and 4 necropsied at the Week 53 interim sacrifice and the Week 105 terminal sacrifice and from animals that died or were sacrificed due to poor health. In addition,

microscopic examinations were done on macroscopic lesions, liver, lungs, kidney, pancreas, thyroid, testes, and mammary glands (females) from animals in Groups 2, 3, and 6 sacrificed during Week 105.

Five animals/sex in Groups 1 through 5 were sacrificed during Week 4, and five animals/sex in Groups 1 through 4 were sacrificed during Week 14 for hepatocellular proliferation rate measurements and hepatic palmitoyl-CoA oxidase activity.

Statistically significant differences cited in the Results and Discussion section are based on comparisons between the control and treated groups.

RESULTS AND DISCUSSION

Mortality

The incidence of mortality during the study was similar for treated and control animals. Thirty-six males and 37 females in the control group, 28 males and 37 females given 3 ppm, 28 males and 35 females given 30 ppm, and 33 males and 31 females given 100 ppm died on test or were sacrificed in moribund condition.

Clinical Pathology

Week 4. Males and females given 300 ppm had mildly, but statistically, higher hepatic palmitoyl-CoA oxidase activity consistent with peroxisomal proliferation.

Week 8. There were many statistically significant or otherwise notable differences for clinical pathology results between animals given the control material and animals given 300 ppm. Those differences considered to be effects of the test material were lower red blood cell count, hemoglobin, hematocrit, glucose, globulin, and cholesterol and higher urea nitrogen, albumin, total bilirubin (males only), aspartate aminotransferase (males only), alanine aminotransferase, and hepatic palmitoyl-CoA oxidase. With the exception of higher alanine aminotransferase for the females, these differences were statistically significant. The effects on the erythrocyte parameters, glucose, and globulin were consistent with poor health and failure to gain weight appropriately. Higher urea nitrogen and albumin were most consistent with mild dehydration and indicated the effects on other parameters (e.g., the erythrocyte parameters) would likely have been greater if the animals were normovolemic. The effects on alanine aminotransferase, aspartate

aminotransferase, and total bilirubin were indicative of the hepatocellular degeneration and necrosis observed microscopically.

Other statistically significant differences were considered to be of uncertain relationship to administration of the test material. Mildly lower platelet count was observed for males but not females. Absolute eosinophil count was statistically lower for both males and females, but the differences were extremely small as normal eosinophil count is very low.

Weeks 14, 27, and 53. There were several statistically significant or otherwise notable differences for clinical pathology results between control and treated animals. Those differences considered to be effects of the test material were not always statistically significant but were generally consistent over time and exhibited a relationship to dose. Several statistically significant differences that were inconsistent over time or did not affect the high-dose group were considered incidental.

Administration of the test material was associated with decreased red blood cell count, hemoglobin, and hematocrit for females given 100 ppm; lower glucose and higher urea nitrogen for males and females given 100 ppm (predominantly at Weeks 14 and 27); higher albumin and lower globulin for males given 100 ppm (predominantly at Weeks 27 and 53); and lower cholesterol for males given 30 or 100 ppm and females given 100 ppm. These effects were consistent with those observed at Week 8 for animals given 300 ppm but were less prominent.

The effect of greatest magnitude was that for cholesterol. At the highest dose level, cholesterol was markedly decreased for the males. The erythrocyte effects and the effects on glucose and urea nitrogen were very mild, and the serum protein effects were considered of moderate severity.

Administration of the test material at 3 ppm for approximately 52 weeks had no effect on clinical pathology test results.

Week 105. Cholesterol remained moderately lower for males given 30 or 100 ppm (Groups 3 and 4), and triglycerides were moderately lower for females given 100 ppm (Group 4). These effects were absent or reversed for animals in the recovery group (Group 6).

Anatomic Pathology - All Animals - Test Material-Related Findings

Macroscopic Findings. Diffusely dark livers were observed only for animals given the test material. Enlargement, mottling, and masses of the liver were slightly more frequent for animals given 100 ppm than for the controls. An increased incidence of light foci of the liver for treated animals was not considered test material-related as most of these were due to tension lipidosis, an incidental finding frequently observed in rats. The incidence of possible test material-related macroscopic findings are listed in Text Table 1.

a Animals placed on recovery.

Microscopic Findings. Test material-related findings were limited to the liver. Administration of the test material caused an increase in cystic degeneration, hepatocellular hypertrophy, hepatocellular vacuolation, necrosis, and hemorrhage.

At the Week 8 sacrifice, hepatocellular hypertrophy, necrosis, and hemorrhage were observed for animals given 300 ppm. Hepatocellular hypertrophy was observed only at the Week 14 sacrifice for animals given 30 or 100 ppm, and hepatocellular vacuolation and hypertrophy were present at the Week 53 sacrifice only for animals given 100 ppm.

For the unscheduled sacrifice animals, cystic degeneration, and hepatocellular hypertrophy were increased for males and hepatocellular vacuolation was increased for treated males and females. Hepatocellular adenomas were minimally higher for treated animals compared with the controls.

Test material-related hepatic findings for animals given 100 ppm at the terminal sacrifice were cystic degeneration (males only), hepatocellular hypertrophy, and vacuolation. Livers from five males, five females in the control group, and five males and five females given 100 ppm were stained with Oil Red O for lipid. The amount of lipid present was slightly higher for males given 100 ppm than for the control males. The incidence and amount of lipid present for control males was one minimal and three slight and for males given 100 ppm it was one minimal, two moderate, and one moderately severe. There was no difference in the amount of lipid present for the females. The incidence of hepatocellular adenomas was slightly higher for males and females given 100 ppm. There was only one hepatocellular carcinoma in the study, and it was present for a terminal sacrifice female given 100 ppm.

The microscopic findings for the Group 6 sacrifice animals given 100 ppm were similar to the controls. However, 2 of the 12 females had hepatocellular adenomas.

The incidence of test material-related microscopic findings for all animals are listed in Text Table 2.

Anatomic Pathology - All Animals - Nontest Material-Related Findings

Macroscopic Findings. The most frequently observed findings at necropsy other than those observed associated with test material-related effects were ventral compression of the brain, pituitary masses, ocular discharge, perineal staining, and malocclusion. Other frequent incidental macroscopic findings for males were red foci in the liver, fluid contents in the gastrointestinal tract, obesity, nodular prostate, and nasal discharge.

Frequently observed nontest material-related findings for females were mammary masses, thickened mammary glands, thin animals, ovarian cyst, uterine cyst, stained hair coat, and dark foci in the stomach.

Microscopic Findings/Neoplastic Findings. The most frequently observed nontest material-related neoplasms were pituitary adenomas, and c-cell adenomas and follicular cell adenomas of the thyroid. Mammary adenomas, fibroadenomas, and carcinomas were frequently present for females. Other tumors were only present in a few animals, and the only rare tumor in the study was a nephroblastoma of the kidney for one male given 3 ppm. Frequently observed nontest material-related neoplasms are listed in Text Table 3.

Text Table 3

Mammary Fibroadenoma	3	1	0	0	23	21	16	13
Mammary Carcinoma	0	0	0	0	9	9	15	11

Microscopic Findings - Nonneoplastic Findings. The most frequently observed incidental nonneoplastic findings were ventral compression of the brain, pituitary hemorrhage, chronic progressive nephropathy, proteinaceous casts of the kidneys, ultimobranchial cysts of the thyroid, pelvic mineralization of the kidneys, alveolar macrophages in the lungs, ventricular dilatation of the brain, and hemorrhage of the adrenal cortex. Frequent nontest material-related microscopic findings for males were chronic active inflammation of the prostate, chronic inflammation of the liver, vacuolation of the adrenal cortex, degeneration and fibrosis of the heart, vascular mineralization of the lungs, acinar atrophy of the pancreas, and erosion, fibrosis, and acute inflammation of foot pads. Other frequently observed incidental microscopic findings for females were mammary galactoceles, angiectasis of the adrenal cortex, ovarian cysts, uterine dilatation, thymic cysts, and bile duct hyperplasia of the liver.

Week 4 Sacrifice

Organ Weights. Terminal body weights were lower for males given 300 ppm. Absolute and relative liver weights were higher for males and females given 100 or 300 ppm. There were no other test material-related changes for absolute organ weights, organ-to-body weight percentages, or organ-to-brain weight ratios.

Macroscopic Findings. There were no gross findings noted at necropsy.

Week 8 Sacrifice

Organ Weights. Terminal body weights were lower and absolute and relative liver weights were significantly higher for males and females given 300 ppm. There were no other test material-related changes for absolute organ weights, organ-to-body weight percentages, or organ-to-brain weight ratios.

Macroscopic Findings. The only test material-related findings at necropsy were large livers for five males and two females given 300 ppm and mottling of the liver for one female given 300 ppm. There were no other test material-related gross findings noted at necropsy.

Microscopic Findings. Test material-related findings were limited to the liver. The test material-related hepatic findings were hepatocellular hypertrophy, hepatocellular necrosis, and hemorrhage. The incidence and severity of the hepatic lesions are listed in Text Table 4.

Organ Weights. Terminal body weights were lower and absolute and relative liver weights were significantly higher for males and females given 100 ppm. There were no other test material-related changes for absolute organ weights, organ-to-body weight percentages, or organ-to-brain weight ratios.

Macroscopic Findings. There were no test material-related gross findings noted at necropsy.

Microscopic Findings. Hepatocellular hypertrophy and vacuolation of the liver were observed only for animals given 100 ppm. The incidence and severity of hepatocellular hypertrophy and vacuolation are listed in Text Table 6. Other test material-related hepatic findings were hepatocellular necrosis for one male and two females given 100 ppm and bile stasis for one male and two females given 100 ppm. One female given 100 ppm had a hepatocellular adenoma. Hepatocellular adenomas are occasionally observed as an incidental finding in 1-year-old rats.

Unscheduled Deaths

There was no test material-related effect for mortality. The only causes of death observed in three or more animals were chronic progressive nephropathy, hepatocellular adenoma, histiocytic sarcoma, mammary carcinoma, mammary fibroadenoma for females, malignant lymphoma and pituitary adenomas for both sexes. By far the most frequent cause of death was pituitary adenomas. The cause of death was undetermined for 22 males and 5 females. The incidence of the most frequently observed causes of death are listed in Text Table 7.

Macroscopic Findings. Diffusely dark livers were observed for four males and three females given 100 ppm. Mottled livers were more frequently observed for females given 100 ppm than for controls. The incidence of mottled livers for females was one control, two females given 3 ppm, and five females given 100 ppm. There were no other test material-related macroscopic findings.

Microscopic Findings. For the unscheduled sacrifice animals, cystic degeneration and hepatocellular hypertrophy were increased for males and hepatocellular vacuolation was increased for males and females. Hepatocellular adenomas were minimally higher for treated animals compared with the controls. Thirty males and 28 females given 100 ppm that were unscheduled deaths were also examined microscopically. The incidence of test material-related microscopic findings for the unscheduled death animals is listed in Text Table 8.

Terminal Sacrifice

Macroscopic Findings. Enlargement, mottling, and masses of the liver were more frequent for animals given 100 ppm than for the controls. There were no enlarged or diffusely dark livers for the controls at the terminal sacrifice. One male given 3 ppm and three males and one female given 100 ppm had enlarged livers. Diffusely dark livers were present for one male and four females given 100 ppm. The incidence of mottled livers was one control female, two males given 3 ppm, four males and one female given 30 ppm, and five males and three females given 100 ppm. Hepatic masses were noted at necropsy for one control male, one male and one female given 3 ppm, and three males and three females given 100 ppm.

Microscopic Findings. Test material-related hepatic findings at the terminal sacrifice for animals given 100 ppm were cystic degeneration, hepatocellular hypertrophy, and vacuolation. There was only one hepatocellular carcinoma in the study and it was present for a terminal sacrifice female given 100 ppm. The incidence of test material-related microscopic findings at the terminal sacrifice is listed in Text Table 9.

Text Table 9

Recovery Sacrifice

Macroscopic Findings. There were no test material-related macroscopic findings at the recovery sacrifice.

Microscopic Findings. The microscopic findings for the recovery sacrifice animals given 100 ppm were similar to the controls. However, 2 of the 12 females had hepatocellular adenomas.

Introduction

A peer review of the histopathology portion of the study entitled: 104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats" was conducted at Covance, Madison, Wisconsin, By Donald N. Kitchen, D.V.M., PhD of Colorado Pathology Services, Inc., Collbran, Colorado. The tissues had been previously examined and the data tabulated by pathologist, Dr. James L. Carter, at Covance.

Experimental Design

A summary of the experimental design for the study is presented below:

Study 6329-212

	No. of Animals		Dietary Levels [a]
Group	Male	Female	(ppm NEtFOSE)
1 (Control) [b]	70	70	0
2 (Low)	60	60	3
3 (Mid)	60	60	30
4 (Mid-High)	70	70	100
5 (High) [c]	70	70	300
6 (Mid-High Recovery)	40	40	100
7 (High Recovery) [c]	40	40	300

[a] T-6316 is 98>1% n-ethyl perfluorooctanesulfonamido ethanol (NetFose); dose levels are expressed as ppm of NEtFOSE.
[b] The control animals received the basal diet only.
[c] Five animals/sex in Group 5 were sacrificed during Week 8; the remaining animals in Groups 5 and 7 were sacrificed and discarded during Week 8.

Colorado Pathology Services, Inc. Project Number: P-1921

Study 6329-228			
Group	No. of Animals		Dietary Levels
	Male	Female	(ppm NEtFOSE)
8 (Control)	70	70	0
9 (Low dose)	70	70	1.0

Methods

The peer review as conducted consisted of three tasks. The first task was the complete review of all slides and confirmation of all diagnoses for 10% of the rats in the control and high dose (Groups 1 and 4) including the recovery (Group 6) of study 6329-212. The animals for complete review were selected by Covance and included the following:

— Main Study ---			
Males		Females	
Control	Group 4	Control	Group 4
90714	90904	91124	91314
90724	90914	91134	91324
90734	90124	91144	91334
90744	90934	91154	91344
90754	90944	91164	91354
90764	90954	91174	91364
90774	90964	91184	91374

Colorado Pathology Services, Inc. Project Number: P-1921

— Recovery Animals 10% —	
Males	Females
91048	91458
91058	91468
91068	91478
91078	91488

The second task consisted of validation of all neoplasms diagnosed by the study pathologist to determine if an acceptable diagnosis had been made.

The third task consisted of a review of livers from all animals and thyroid glands from all male animals, suspected target tissues.

Tasks two and three were performed on both studies, ie. 6329-212 and 6329-228.

Results

All the materials necessary for this review were readily available and well organized. Relevant in-life data and necropsy data were available to the reviewing pathologist. All slides required to be examined by the reviewing pathologist, were present and were considered to be of good quality. The quality of the histotechnique and the hematoxylin and eosin (H&E) staining were also considered to be good. No tissue artifacts were present that interfered with the slide evaluation and the stain provided good balance between nuclear and cytoplasmic staining. All slides were adequately labeled. Dr. James L. Carter the study pathologist, and Marcia J. Holland, histology supervisor, were especially helpful in providing the reviewing pathologist with materials and information needed to complete the peer review.

The differences noted during this review were examined and discussed by the study pathologist, the reviewing pathologist and the 3M pathologist (Dr. Marvin Case) utilizing a multiple headed microscope. All differences noted during this review were resolved with complete agreement concerning the final diagnoses.

Colorado Pathology Services, Inc. Project Number: P-1921

Summary

The excellent organization of all materials prior to the arrival of the reviewing pathologist greatly aided and simplified this peer review. The slides were well identified, organized by task and of excellent quality. All differences noted during this review were resolved with complete agreement concerning the final diagnoses.

STATISTICAL REPORT OF SURVIVAL, NONNEOPLASTIC AND NEOPLASTIC LESIONS

Methods

Survival. Evaluations of trend and heterogeneity of survival data were performed using the Cox-Tarone binary regression method and the National Cancer Institute (NCI) Life Table Package (Thomas, Breslow, and Gart, 1977). Week 105 was treated as the end of the study in the NCI package for both sexes. Animals that died accidentally and those that were sacrificed at scheduled intervals were censored in the analysis. Continuity corrected one-sided tail probabilities for trend and two-sided tail probabilities for group comparisons were evaluated at the 5.0% significance level as reported in Text Tables 1 and 2. Kaplan-Meier product limit survival curves are presented in Text Figures 1 and 2 for males and females, respectively.

Nonneoplastic Lesions. Nonneoplastic lesions were chosen for statistical analyses if the incidence rate in at least one treated group (Groups 2 through 4) was increased or decreased by at least two occurrences over the control group (Group 1). The high recovery group (Group 6) was selected based on the incidence rate (%) if it was increased or decreased by at least two as compared to the control or high-dose group. When there was only one incidence in the high recovery and none in the other groups, that case was excluded from statistical evaluation. These were analyzed by the Cochran-Armitage test for trend and the Fisher-Irwin exact test for control versus treatment comparisons (Thakur, Berry, and Mielke, 1985). One-sided tail probabilities for trend and group comparisons were evaluated at the 5.0% significance level and are reported in Text Tables 3 and 4 for males and females, respectively.

Neoplastic Lesions. Neoplastic lesions were chosen for statistical analyses if the incidence rate in at least one treated group was increased or decreased by at least two occurrences over the control group. The incidental tumors (i.e., tumors that were not assigned to be the cause of death of the animals by the study pathologist) were analyzed by logistic regression of tumor prevalence (Dinse and Lagakos, 1983). The logistic regression model included linear and quadratic terms in age (week of death), but the quadratic term was eliminated if there was a lack of convergence. The fatal and palpable (superficial) tumors were analyzed by Cox-Tarone binary regression method, as in the case of survival, using the death time or the first palpation time (as applicable) as the tumor onset time. In the case of any particular tumor type where the study pathologist assigned the tumor in question as being the cause of death of a subset of the animals and the rest of the

animals were assumed to be dead of other competing risks, IARC-type (Peto, et al., 1980) cause of death analysis was performed. Specifically, the subset of the tumors, which were assigned to be the cause of death by the examining pathologist, was analyzed by Cox-Tarone logistic regression under life table techniques. The subset, which was considered incidental by the pathologist, was analyzed by logistic regression of tumor prevalences. For the cases of tumor types where cause of death was undetermined, these were treated as incidental for statistical evaluation. The score statistics and their respective variances from the above tests were then used to compute the combined evidence as described by Gart, et al., (1986). In the case of only one tumor belonging to one of the two categories (fatal and incidental) in a test, it was combined with the other category for the purpose of statistical analyses. In addition, in cases where there was lack of convergence for the asymptotic test of the logistic regression method, the exact probability of the test was obtained by using LogXact-Turbo (1993) and combined with the probability of the Cox-Tarone test, if necessary.

Common and rare tumors were evaluated at the 1.0% and 5.0% significance levels, respectively, for trend. The benign and malignant neoplastic incidences were evaluated separately, but were combined where appropriate. The criteria for combination were based on the work of McConnell et al. (1986). The incidences of multiple-organ findings such as hemangioma, hemangiosarcoma, lipoma, liposarcoma, fibroma, fibrosarcoma, leiomyoma, leiomyosarcoma, endometrial stromal polyp, and endometrial stromal sarcoma were counted by animal, not by tissue type. They were evaluated statistically if they met the selection criterion for the analysis. The statistical results for these cases may be biased because not all the animals were examined for every tissue. Pairwise one-sided group comparisons were evaluated at the 5.0% significance level. One-sided tail probabilities for trend analysis and group comparisons are shown in Text Tables 5 and 6 for males and females, respectively.

Groups 5 (High-dose) and 7 (High recovery) were excluded from all the analyses except the survival graphs (Text Figures 1 and 2) due to early sacrifices at Week 8. In the nonneoplastic analyses, animals sacrificed early (Week 4) in Groups 1 through 4 (Control, Low, Mid, and Mid-High, respectively) were excluded from the denominators. In the statistical evaluations of the neoplastic lesions, animals sacrificed early (during or before Week 14) in Groups 1 through 4 were discounted from the number of animals at risk. Further, in the neoplastic analyses, in the cases where the low, mid, and mid-high recovery groups did not have a complete histopathology examination, they were excluded from statistical analyses.

In the text tables, the p-values under Group 1 (Control) are for trend analysis and the p-values under Groups 2 (Low), 3 (Mid), 4 (Mid-High), and 6 (Mid-High recovery) are for the comparison of that group versus the control group. Group 6 was also compared with Group 4, and the p-values for those comparisons are indicated in the text tables. Trend analysis includes Groups 1, 2, 3, and 4 only.

Ordinal dose levels 0, 1, 2, and 3 were used in all analyses for Groups 1, 2, 3, and 4, respectively. Continuity correction was done for all asymptotic tests. The following notations are used throughout this report to designate direction and significance of effects.

+	=	Effect in the increased direction
-	=	Effect in the decreased direction
*	=	Significant at $p \leq 0.05$
**	=	Significant at $p \leq 0.01$
E	=	Exact permutation test
NA	=	Not analyzed

Results and Discussion

Survival. As indicated in Text Tables 1 and 2, no significant trends or group comparisons in mortality were observed in males and females.

Nonneoplastic Lesions. The liver in both sexes has been identified as the only organ that is appropriate to perform statistical analysis for nonneoplastic lesions.

As indicated in Text Table 3, there were significant positive trends in the incidences of hepatocellular vacuolation and hepatocellular centrilobular hypertrophy ($p = 0.00003$ and 0.00000, respectively) for males. These cases were associated with significant increases in the mid-high dose group ($p = 0.00009$ and 0.00000, respectively), when compared with the control. However, the mid-high recovery group animals in these cases exhibited significantly decreased incidences over the mid-high dose group ($p = 0.00107$ and 0.00035, for both cases) implying that the effect may be transient (reversible) in nature. A significant positive trend was also observed for cystic degeneration ($p = 0.00183$) in association with significantly increased incidences in both the mid- and mid-high dose males over the control ($p = 0.01634$ and 0.00589, respectively). There was no such effect in the females for this parameter. Unless this is a sex specific effect, it can be considered to be a chance variation. Further, significantly increased incidences

were observed in the mid-high recovery males, when compared with both control and mid-high dose males for hemorrhage (p = 0.03442 and 0.00462, respectively) and the low-dose group for telangiectasis as compared to the control (p = 0.04854). However, no significant trends were found in these cases, which diminishes their importance.

As indicated in Text Table 4, there were significant positive trends in the incidences of hepatocellular vacuolation, hepatocellular centrilobular hypertrophy, and bile duct hyperplasia (p = 0.02018, 0.00001, and 0.00463, respectively) for females. These cases were associated with significant increases in the mid-high-dose group (p = 0.01050, 0.00025, and 0.01750, respectively), when compared with the control. However, the mid-high recovery group animals have exhibited significantly decreased incidences over the mid-high-dose group (p = 0.02638, 0.00066, and 0.00782, respectively), which implies their transient nature. Marginally significant increases over the control were also revealed in the incidences of low- and mid-high-dose groups for chronic inflammation (p = 0.03410 and 0.02681, respectively). However, no significant trend was found in this case.

Neoplastic Lesions. As indicated in Text Table 5, significant positive trends were noted only in the incidences of thyroid follicular cell adenoma and its combined adenoma and carcinoma (p = 0.0171 and 0.0155, respectively) for males. These cases were associated with significant increases in the mid-high-dose group (p = 0.0107, for both cases) over the control. However, thyroid follicular cell carcinoma did not show any significant effect. Also, the trends mentioned earlier are nonmonotonic. Follicular cell adenoma in the thyroid of the Sprague Dawley rat is a common tumor (>1% background) for which the FDA uses a 1.0% significance level for trend evaluation. Therefore, these trends are not deemed to be biologically significant. There were no other significant neoplastic findings in the males of this study.

As indicated in Text Table 6, significant positive trends were observed only in the incidences of hepatocellular adenoma and combined adenoma and carcinoma (p = 0.0050 and 0.0022, respectively) for females. These cases were associated with significant increases in the mid-high-dose and mid-high recovery groups (p = 0.0120 and 0.0498, respectively for adenoma and p = 0.0069 and 0.0498, respectively, for adenoma/carcinoma), as compared with the control. However, hepatocellular carcinoma did not show a significant effect. There were significant negative trends in the incidences of mammary fibroadenoma; adenoma and fibroadenoma combined; and the combined adenoma, fibroadenoma, and carcinoma incidences (p = 0.0033, 0.0051, and 0.0122,

respectively). All these cases were associated with significantly lower incidences in the respective mid-high-dose group ($p = 0.0094$, 0.0113, and 0.0181, respectively). Furthermore, a marginally decreased incidence over the control was noted for the mammary combined fibroadenoma, adenoma, and carcinoma incidences ($p = 0.0403$). No significant trend or group comparisons were found in the incidences of mammary carcinoma. Significant negative trends were also noted in the incidences of pituitary adenoma and combined adenoma and carcinoma ($p = 0.0291$, for both cases). But none of the pairwise comparisons were significant in these cases. There was no significant trend or group effect in the pituitary carcinoma. There were no other significant neoplastic findings in females.

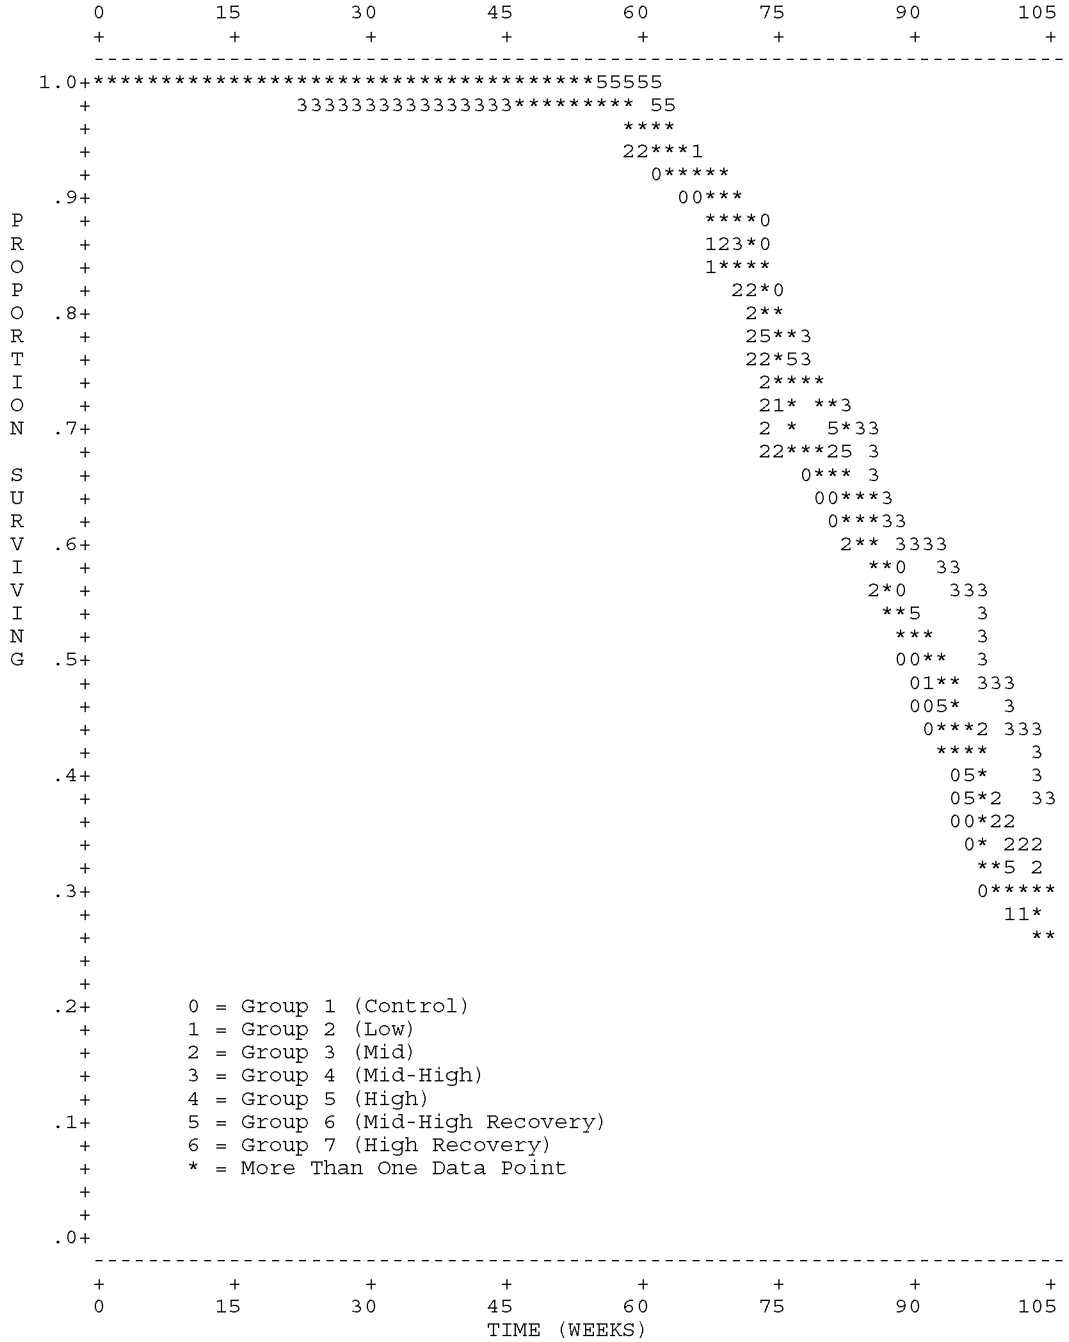
TEXT FIGURE 2
KAPLAN-MEIER PRODUCT LIMIT ESTIMATE CURVES OF SURVIVAL: FEMALE RATS



COMMENTS ON THE DATA

Various models of calculators, computers, and computer programs were used to analyze data in this study. Because different models round off or truncate numbers differently, values in some tables (e.g., means, standard deviations, or individual values) may differ slightly from those in other tables, from individually calculated data, or from statistical analysis data. Neither the integrity nor the interpretation of the data was affected by these differences.

The units for the dose levels in the inlife summary tables are ppm.

The number of animals listed in the heading of the summary tables for clinical and mass observations reflects the number of animals assigned to each group at the start of the study.

The summary tables for clinical observations indicates the number of animals for which a condition was observed without regard to the reversibility, number of incidences/animal, or the length of time the condition persisted.

Only observations for each animal other than normal are indicated in the summary clinical observations tables.

Each animal with observations recorded as "Normal" throughout the study has the comment "No remarkable observations" indicated in the individual clinical observations tables.

The specific details for comments in the individual clinical observations tables that are indicated with a "C" can be found at the end of each group for each sex.

The values for summary and individual test material consumption are reported with more significant figures than is appropriate for the data due to limitations of the data collection and reporting software.

Food consumption values are reported in whole numbers; however, the data collection system carries food consumption values to one place to the right of the decimal for food efficiency and test material consumption calculations. The differences in values generated do not influence the interpretation of the calculation.

The comment "SPILLED" in individual food consumption data tables indicates that food consumption was not recorded due to spillage during the interval.

The comment "CNTMD" in individual food consumption data tables indicates that food consumption was not recorded due to contamination of the diet with urine or feces in the food container.

COMMENTS ON THE DATA (Continued)

The comment "NOT TAKEN" in individual food consumption data tables indicates that the animal died before the end of the food consumption interval.

Differences in the population size (N) in the summary tables for clinical and anatomic pathology are explained in the individual data tables or the codes sheets or in the Protocol Deviations section.

Results of clinical pathology samples collected for animals sacrificed at unscheduled intervals appear in the individual clinical pathology tables for the next scheduled interval. These results are not in the summary tables and are not included in the statistical analyses.

Statistical analyses were not done when there were two or fewer values for a parameter.

The calculation for individual test material consumption is:

Test material consumption =

$$\frac{\text{Diet Concentration} \times \text{Food Consumption}}{\text{Food Consumption Interval} \times [\text{First Body Weight of Interval} + (\text{Daily Body Weight Gain} \times \text{Day Factor})]}$$

where: Daily Body Weight Gain =

$$\frac{\text{Last Body Weight of Interval} - \text{First Body Weight of Interval}}{\text{Day of Last Body Weight of Interval} - \text{Day of First Body Weight of Interval}}$$

and: Day Factor =

$$(\text{Food Consumption Start Day} - \text{Day of First Body Weight of Interval}) + \frac{\text{Food Consumption Interval}}{2}$$

and: Food Consumption Interval =

$$\text{Food Consumption End Day} - \text{Food Consumption Start Day}$$

CODES, ABBREVIATIONS, AND UNITS

General Codes and Abbreviations
Codes for Clinical Pathology
Abbreviations and Units for Clinical Hematology
Abbreviations and Units for Clinical Chemistry
Abbreviations and Units for Clinical Urinalysis
Abbreviations and Units for Urine Chemistry
Codes for Anatomic Pathology

Note: The following lists of codes, abbreviations, and units are used by Covance. Some, but not necessarily all, of this information may be needed for this report.

General Codes and Abbreviations

WK	Week
N	Number of measurements in a group
Mean; MEAN	Arithmetic mean
CAM	Covariate-adjusted mean
SD; S.D.; STAND DEV; STANDARD DEV; sd	Standard deviation
*	Group mean is significantly different from the mean of the control group (Group 1) at $p \leq 0.05$
-; NA	No value; not applicable; not present
P	Present
C	Comment found at the end of each group for each sex
UNSCHED	Unscheduled
DISPATCH	Observations transferred from the inlife module of the data collection system to the necropsy module for reference during necropsy. Observations are duplicates of the last inlife observations.

Animal Death Codes

1	Interim sacrifice, Week 4
2	Interim sacrifice, Week 8
3	Interim sacrifice, Week 14
4	Interim sacrifice, Week 52
6	Interim sacrifice, Week 8
T	Terminal sacrifice
D	Found dead
M	Moribund
U	First postrecovery sacrifice

Codes for Clinical Pathology

GENERAL CODES

NS	No sample
QS/QNS	Quantity not sufficient
NR	No repeat (sample volume not sufficient for repeat analysis)
FS	Fibrin strands
SC	Sample clotted
SH	Slightly hemolyzed
H	Hemolyzed
SL	Slightly lipemic
L	Lipemic
SI	Slightly icteric
I	Icteric
NF	Animal not fasted
U	Unscheduled/moribund bleed
DT/DOT	Animal died on test
DB	Died during bleeding
TJ	Technician judgment to repeat test
TE	Technical error (instrument or technician error that results in unacceptable data, e.g., unacceptable instrument output, sample spilled, entry of invalid data)
RE	Recording error (recorded incorrect data, e.g., wrong number, spelling error, incorrect date)
EE	Entry error (incorrect keyboard entry)
SE	Sampling error
PC	Platelets clumped
PD	Platelets decreased
PI	Platelets increased
PL	Platelets large
PA	Platelets appear adequate
CO	Color interferes with test
HB	Heinz bodies observed
PLASMO	Plasmodium
NO AGG	No aggregation
FR	Fractious
UTD	Unable to determine
NO COAG	No coagulation

Codes for Clinical Pathology (Continued)

RESULTS NOT INCLUDED IN STATISTICAL ANALYSES

Hemolyzed clinical chemistry or coagulation samples
Samples from animals at unscheduled intervals
Prothrombin times (PT) greater than 50 seconds
Activated partial thromboplastin times (PTT) greater than 110 seconds
Bleed times (BLETIME) greater than 30 minutes

CODES FOR BLOOD CELL MORPHOLOGY

The following scale was used to measure the degree of anisocytosis (ANISO), poikilocytosis (POIK), polychromasia (POLY), hypochromasia (HYPO), or basophilic stippling (BASTIP) or the presence of Howell-Jolly bodies (HJBODY), toxic neutrophils (TOXNEUT), or atypical lymphocytes (ATYPLYM).

Scale	Degree	Presence
-	Normal for the species	Not present
1	Slight	Rare
2	Moderate	Few
3	Marked	Moderate
4	Not applicable	Many

URINE APPEARANCE

Color						Clarity		Miscellaneous	
A	Pale	E	Amber	I	Black	J	Clear	M	Debris
B	Straw	F	Brown	P	Blue/green	K	Hazy	O	Feces
C	Yellow	G	Red	Q	Blue	L	Cloudy		
D	Dark yellow	H	Green	R	Orange				

Codes for Clinical Pathology (Continued)

URINE CHEMISTRY MULTISTIX® STRIP

Urine Glucose		Urine Ketone		Urine Blood	
-	Negative	-	Negative	-	Negative
+	100 mg/dL	+	5 mg/dL	+	Small
++	250 mg/dL	++	15 mg/dL	++	Moderate
+++	500 mg/dL	+++	40 mg/dL	+++	Large
++++	1,000 mg/dL	++++	80 mg/dL		
+++++	≥2,000 mg/dL	+++++	160 mg/dL		

Urine Urobilinogen		Urine Bilirubin	
-	0.2 mg/dL	-	Negative
+	1 mg/dL	+	Small
++	2 mg/dL	++	Moderate
+++	4 mg/dL	+++	Large
++++	8 mg/dL		

(1 mg = approximately 1 Ehrlich unit)

URINE SEDIMENT

Cells, Crystals, Casts, and Comments				Bacteria	
A	Amorphous urates	Q	Sperm	0	Not present
B	Amorphous phosphates	R	Fecal contamination	1	Few
C	Uric acid	S	Pinworm ova found	2	Moderate
D	Triple phosphates	T	Pinworm larvae found	3	Many
E	Calcium oxalate	U	Parasite ova found		
F	Calcium carbonate				
G	Granular casts				
H	Hyaline casts	0	Not present		
I	Cellular casts	1	1 - 5 per field		
J	Waxy casts	2	6 - 10 per field		
K	Unknown crystal	3	11 - 20 per field		
P	Mucous threads	4	>20 per field		

Abbreviations and Units for Clinical Hematology

Test	Abbreviation (Units)
Red blood cell count	RBC (E6/UL or $X10^6/\mu L$)
Hemoglobin	HGB (G/DL)
Hematocrit	HCT (%)
Mean corpuscular volume	MCV (FL)
Mean corpuscular hemoglobin	MCH (PG)
Mean corpuscular hemoglobin concentration	MCHC (%)
Platelet count	PLT (E3/UL or $X10^3/\mu L$)
Mean platelet volume	MPV (FL)
Reticulocyte count	RETIC (%)
Absolute reticulocyte count	RETIC (E3/UL or $X10^3/\mu L$)
Heinz body count	HEINZ (%)
Erythrocyte sedimentation rate	ESR (MM/HR)
Prothrombin time	PT (SEC)
Activated partial thromboplastin time	PTT (SEC)
Thrombin time	TT (SEC)
Activated coagulation time	ACT (SEC)
Fibrinogen	FBR (MG/DL)
Fibrin/fibrinogen degradation products	FDP (UG/ML)
Platelet aggregation	
Collagen	PAGG/COL (%)
Adenosine diphosphate	PAGG/ADP (%)
Alpha 2-antiplasmin	ANTIPLAS (%)
Bleeding time	BLE TIME (SEC)
Methemoglobin	METHGB (%)
Plasma hemoglobin	PLA HGB (MG/DL)
Myeloid/erythroid ratio	M/E RATIO
Estimated myeloid/erythroid ratio	EST M/E RATIO
White blood cell count	WBC (E3/UL or $X10^3/\mu L$)
Differential blood cell count	
Segmented neutrophil count	N-SEG (E3/UL or $X10^3/\mu L$) and %
Lymphocyte count	LYMPH (E3/UL or $X10^3/\mu L$) and %
Monocyte count	MONO (E3/UL or $X10^3/\mu L$) and %
Eosinophil count	EOSIN (E3/UL or $X10^3/\mu L$) and %
Basophil count	BASO (E3/UL or $X10^3/\mu L$) and %
Anisocytosis	ANISO (-,1,2,3)
Polychromasia	POLY (-,1,2,3)
Poikilocytosis	POIK (-,1,2,3)
Toxic neutrophils	TOXNEUT (-,1,2,3,4)

Abbreviations and Units for Clinical Chemistry

Test	Abbreviation (Units)
Glucose	GLU (MG/DL)
Urea nitrogen	UN (MG/DL)
Creatinine	CREAT (MG/DL)
Total protein	T PRO (G/DL)
Albumin	ALB (G/DL)
Globulin	GLOB (G/DL)
Total bilirubin	T BILI (MG/DL)
Cholesterol	CHOL (MG/DL)
Triglyceride	TRIG (MG/DL)
Aspartate aminotransferase	AST/SGOT (IU/L)
Alanine aminotransferase	ALT/SGPT (IU/L)
Gamma glutamyltransferase	GGT (IU/L)
Palmitoyl CoA oxidase	PCOAO (IU/G)
Calcium	CA (MG/DL)
Inorganic phosphorus	I PHOS (MG/DL)
Sodium	NA (MMOL/L)
Potassium	K (MMOL/L)
Chloride	CL (MMOL/L)

Abbreviations and Units for Clinical Urinalysis

Test	Abbreviation (Units)
Urine volume	U VOL (ML)
Specific gravity	SP GR
Urine chemistry Multistix® strip	
Urine pH	U PH
Urine protein	U PRO (MG/DL)
Urine glucose	U GLU
Urine ketones	U KET
Urine bilirubin	U BILI
Urine blood	U BLOOD
Urine urobilinogen	UROBILI
Microscopic examination of urine sediment	
Red blood cells per high-power field	RBC (PER HPF)
White blood cells per high-power field	WBC (PER HPF)
Epithelial cells per high-power field	EPITH (PER HPF)
Bacteria per high-power field	BACT (PER HPF)
Casts per low-power field	CASTS (PER LPF)
Crystals per low-power field	CRYSTALS (PER LPF1 or PER LPF2)
Urine appearance	URINE APP1 or URINE APP2
Comments	COMMENTS

Abbreviations and Units for Urine Chemistry

Test	Abbreviation (Units)
Urine sodium	U NA (MMOL/L)
Urine potassium	U K (MMOL/L)
Sodium excretion	NA EXC (MMOL)
Potassium excretion	K EXC (MMOL)

Codes for Anatomic Pathology

Code	Definition

MACROSCOPIC CODES

EX	Indicates that organ weight is excluded from calculations
NOT TAKEN	Organ weight not taken; explanation given in necropsy notes
MISSING	Organ missing or lost
UNSUITABLE	Organ technically unsuitable for weighing
AUTOLYTIC	Organ autolyzed and could not be weighed
EXCLUDE	Weight was taken, but was excluded from all calculations

MICROSCOPIC CODES

Codes Prefacing Neoplastic Findings

B-	Primary, benign neoplasm
M-	Primary, malignant neoplasm
N-	Metastatic neoplasm
I-	Locally invasive neoplasm
X-	Other neoplasm

Distribution of Findings

Focal
Diffuse
Multifocal

Grades for Severity or Amount

1	Minimal - the least amount of change that can be observed with the light microscope
2	Slight - less than average amount of change, but readily discernible as abnormal
3	Moderate - the average amount of change that is expected for a lesion
4	Moderately severe (marked) - a marked amount of change with possible loss of function of the affected cells or organs
5	Severe - a great amount of change with probable loss of function of the affected cell or organs and frequently involves large areas of the organ

Codes for Anatomic Pathology (Continued)

Other Microscopic Codes

TL	Total
P	Finding present
-	Finding not present
MN	Mean

TISSUE ABBREVIATIONS

Abbreviation	Definition
LN	Lymph node
GL	Gland
STOMACH, GL	Glandular stomach
STOMACH, NONGL	Nonglandular stomach
SALIV GL, MANDIB	Mandibular salivary gland
LN, ANT MES/PANC	Anterior mesenteric/pancreatic lymph node
AUDITORY SEB GL	Auditory sebaceous gland
LACRIMAL GLAND, EX	Exorbital lacrimal gland
HEMATO NEOPLASIA	Hematopoietic neoplasia
LACRIMAL GL, INT	Internal lacrimal gland
CAVITY, ABDOM	Abdominal cavity
SALIV GL,PAROTID	Parotid salivary gland
LN, TRACHEOBRON	Tracheobronchial lymph node

FINAL REPORT

Study Title:

104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats

Author:

Peter J. Thomford, PhD

Study Completion Date:

December 13, 2001

Testing Facility:

Covance Laboratories Inc.
3301 Kinsman Boulevard
Madison, Wisconsin 53704-2595

Laboratory Study Identification:

Covance 6329-212

Sponsor Study Identification:

3M T-6316.1

APPENDIX 1

Protocol Deviations

Protocol Deviations

Protocol. Test Material. Purity. 98.1% N-EtFOSE (w/w).

Actual Procedure. The purity of the test material, as determined by Centre Analytical Laboratories, Inc. on 26 November 2000, was 97.4%.

Protocol. Animals. Weight at Initiation of Treatment. Animals will weigh 100 to 300 g at initiation.

Actual Procedure. Six animals weighed between 301 to 310 g at initation.

Protocol. Husbandry. Water. Water will be provided *ad libitum*.

Actual Procedure. During the a.m. clinical observations on August 18, 1998, it was noted that animals in Cage Rack 3 were without water. Animals appeared in good condition. Animals involved were not specified in the data.

During the a.m. clinical observations on June 25, 1998, it was noted that Group 4 males were without water. Animals appeared in good condition.

Protocol. Dosing Procedures. Method of Administration. Animals will be offered diet *ad libitum*, unless otherwise specified.

Actual Procedure. Animal No. C91073, Group 6 male, was found without a feed jar on March 8, 1999. Animal No. C90899, Group 3 male, was found without a feed jar on December 8, 1999. Animal No. C91336, Group 4 female, was found with an empty feed jar on May 2, 1999. Animal No. C90934, Group 4 male, was found without a feed jar on January 10, 2000.

Protocol. Dosing Procedures. Dose Preparation. All dose preparations will be stored at room temperature.

Protocol Deviations (Continued)

Actual Procedure. Diets mixed for Weeks 4 through 7 were stored in a refrigerator for approximately 16.5 hours during Week 4.

Protocol. Dosing Procedures. Retention Samples. Samples will be collected from each dose preparation.

Actual Procedure. Samples for the Week 4 through 7 preparation were not collected until February 23, 1998 (Week 5) from the diet that was inadvertently stored in the refrigerator for approximately 16.5 hours.

Protocol. Dosing Procedures. Retention Samples. Unused retention samples will be discarded at least 1 month after completion of the inlife phase.

Actual Procedure. Unused retention samples were discarded on March 21, 2000. Group 1 retention samples for Weeks 64 through 67 were not located.

Protocol. Dose Analyses. Homogeneity. Samples will be analyzed in triplicate.

Actual Procedure. Samples were analyzed in duplicate for the mix on August 26, 1999.

Protocol. Observation of Animals. Clinical Observations. Each animal will be observed twice daily (a.m. and p.m.).

Actual Procedure. Completion of the p.m. observations on August 10, 1999 was not documented in the data.

Protocol. Observation of Animals. Clinical Observations. Animals will be removed from cages weekly and abnormal findings will be recorded.

Protocol Deviations (Continued)

Actual Procedure. During the weekly data collection, Animal No. C91468, Group 6 female, had severe convulsions and died (April 12, 1999). These observations were not documented.

Protocol. Observation of Animals. Body Weights. Body weights will be collected weekly for Weeks 1 through 17.

Actual Procedure. Body weight for Week 5 for Animal No. C91010, Group 5 male, were excluded due to an apparent weighing error.

Protocol. Observation of Animals. Food Consumption. Food consumption will be measured weekly for Weeks 1 through 16.

Actual Procedure. Food consumption for Animal No. C90995, Group 5 male, was excluded for Week 2 due to an apparent weighing error.

Protocol. Clinical Pathology. Blood Films. "Blood films will be taken as part of the necropsy procedure."

Actual Procedure. A blood film was not taken for Animal No. C91211, Group 2 female, at the Week 105 sacrifice.

Protocol. Serum Analyses. Method of Collection. Approximately 3 mL of blood will be collected at the Week 105 sacrifice for possible future serum analyses.

Actual Procedure. A sample was not obtained for Animal No. C91211, Group 2 female, at the Week 105 sacrifice.

Protocol Deviations (Continued)

Protocol. Hepatocellular Proliferation and Biochemical Analyses. Palmitoyl-CoA Oxidase Tissue Collection and Analyses. A 500-mg sample of the right lateral lobe of the liver will be collected.

Actual Procedure. A 500-mg sample from the right median lobe was collected for the following animals at Week 14. Animal Nos. C90831, C90797 (Group 2 males), C91281 (Group 3 female), C90780 (Group 1 male), C90960 (Group 4 male), C91241 (Group 2 female), and C91370 (Group 4 female).

Protocol. Termination. Uncheduled Sacrifices and Deaths. Animals sacrificed during or after Week 13 will be anesthetized with carbon dioxide.

Actual Procedure. Animal Nos. C90806 and C90808 (Group 2 male) and Animal No. C91484 (Group 6 female) were sacrificed using sodium pentobarbital.

Protocol. Termination. Unscheduled Sacrifices and Deaths. Animals will be weighed prior to exsanguination.

Actual Procedure. The following animals were not weighed: Animal Nos. C91139, Group 1 female; C90806, Group 2 male, C91203, Group 2 female; C91210, Group 2 female; C90849, Group 3 male; C90946, Group 4 male; C90949, Group 4 male; C91358, Group 4 female; C91029, Group 5 male; and C91068, Group 6 male.

Protocol. Postmortem Procedures. Organ Weights Specified organs will be weighed at the Week 8 sacrifice.

Actual Procedure. Due to an apparent weighing error, organ weights for the left thyroid/parathyroid for Animal Nos. C90756 (Group 1 male), C91017 (Group 5 male), and C91393 (Group 5 female) were excluded.

Protocol Deviations (Continued)

Protocol. Postmortem Procedures. Tissue Preservation. Lesions will be collected from each animal that dies at an unscheduled interval.

Actual Procedure. The last inlife observation for Animal No. C91268, Group 3 female, of crusted footpad for the left hindfoot was confirmed at necropsy. This lesion was not collected and the right hindfoot was inadvertently collected.

Protocol. Postmortem Procedures. Tissue Preservation. Mandibular salivary gland will be collected, preserved, and examined microscopically for animals in Group 4.

Actual Procedure. Two sets of mandibular salivary glands were noted in the wet tissue collection for Animal No. C91312, Group 4 female. Neither set was submitted for microscopic examination.

Protocol. Postmortem Procedures. Tissue Preservation. The following tissues from each animal will be preserved in 10% neutral-bufferd formalin.

Actual Procedure. Some tissues, required by protocol, were not available for preservation or histopathologic examination. Missing tissues are listed with appropriate comments in the pathology data sheets for individual animals. Summary tables do not include them as having been examined.

These deviations are not expected to have affected the results of the study.

FINAL REPORT

Study Title:

104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats

Author:

Peter J. Thomford, PhD

Study Completion Date:

December 13, 2001

Testing Facility:

Covance Laboratories Inc.
3301 Kinsman Boulevard
Madison, Wisconsin 53704-2595

Laboratory Study Identification:

Covance 6329-212

Sponsor Study Identification:

3M T-6316.1

VOLUME IV OF XII **Page**

APPENDIX 3 1226
Individual Body Weight Data (g) 1227

APPENDIX 4 1306
Individual Food Consumption Data (g) 1307
Individual Test Material Consumption Data (mg/kg/day) 1384

APPENDIX 5 1456
Individual Clinical Hematology Data 1457
Individual Clinical Chemistry Data 1499
Individual Clinical Urinalysis Data 1541
Individual Urine Chemistry Data 1583

APPENDIX 3

Individual Body Weight Data (g)

Appendix 3

Individual Body Weight Data (g)

104-WEEK DIETARY CARCINOGENICITY STUDY WITH NARROW RANGE (98.1%)
N-ETHYL PERFLUOROOCTANESULFONAMIDO ETHANOL IN RATS

FINAL REPORT

Study Title:

104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats

Author:

Peter J. Thomford, PhD

Study Completion Date:

December 13, 2001

Testing Facility:

Covance Laboratories Inc.
3301 Kinsman Boulevard
Madison, Wisconsin 53704-2595

Laboratory Study Identification:

Covance 6329-212

Sponsor Study Identification:

3M T-6316.1
