FINAL REPORT

Study Title:

104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats

Author:

Peter J. Thomford, PhD

Study Completion Date:

December 13, 2001

Testing Facility:

Covance Laboratories Inc.
3301 Kinsman Boulevard
Madison, Wisconsin 53704-2595

Laboratory Study Identification:

Covance 6329-212

Sponsor Study Identification:

3M T-6316.1

FINAL REPORT AMENDMENTS

Study Number:	Covance Study No. 6329-212
Title:	104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats
Date of Final Report:	August 17, 1998
Amendments:	(1) Cover page: Header and company name changed to reflect new name. Company name also changed on page I-1 , paragraph 2 in PURPOSE section. (2) Cover page: "FINAL" deleted. (3) Table of Contents page added; Section pages I-VI added. (4) Header changed globally to reflect section in the page number and to reflect amended final report. (5) PURPOSE: Paragraph added to reflect that Dr. Carolyn Moyer was unable to sign the final report and that Dr. Mark Butt signed in her place. (6) RESULTS: Reference to Tables and Figures changed to reflect Sections containing Tables and Figures. (7) RESULTS: Histopathology findings moved from Appendix I to Section IV. (8) Page I-4, Line 5: Week 8 changed to week 14. (9) Page numbers changed to reflect section. (10) Tables: Removed "Pathology Associates International" from footer. (11) Signature page changed from Section IV to Section V. (12) QA Statement changed from Section V to Section VI. (13) Entire report: font changed.

Reason for Amendments:

(1) Pathology Associates International acquired by Charles River Laboratories with subsequent name change to Pathology Associates - A Charles River Company.

I. REPORT NARRATIVE

CELL PROLIFERATION REPORT FOR:

104-WEEK DIETARY CARCINOGENICITY STUDY WITH NARROW RANGE (98.1%) N-ETHYL PERFLUOROOCTANESULFONAMIDO ETHANOL IN RATS COVANCE STUDY NUMBER 6329-212

PURPOSE

The purpose of the study was to assess the carcinogenicity of the test material when administered in the diet to rats for at least 104 weeks.

This report, submitted by Pathology Associates - A Charles River Company (PAI), formerly Pathology Associates International, to the study Sponsor, 3M, represents the cell proliferation findings and interpretation for Covance Study Number 6329-212 entitled "104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol In Rats". All aspects of the tasks associated with PAI's portion of this study were conducted in compliance with the Food and Drug Administration Good Laboratory Practice (GLP) Regulations as set forth in Title 21 of the US Code of Federal Regulations, Part 58, issued December 22, 1978 (effective June 20, 1979), and with any applicable amendments.

At the request of the Sponsor, the portion evaluated and reported by Dr. Carolyn Moyer has been signed by Dr. Mark Butt, General Manager and Director of Pathology at PAI. Dr. Moyer is currently on medical leave and unavailable for signature.

MATERIALS AND METHODS

Tissue Collection for Cell Proliferation

Five animals per sex per group in groups 1 through 5 were sacrificed during week 4, five animals per sex per group in groups 1 and 5 were sacrificed during week 8, and five animals per sex per group in groups 1 through 4 were sacrificed during week 14 for hepatocellular proliferation. A section of the left lateral lobe of the liver from each of 5 rats per group (groups 1-5) was fixed and processed to paraffin block by Covance per protocol specifications. Tissue blocks were shipped to PAI for sectioning and staining. From each block, a slide was prepared for H&E evaluation and immunohistochemical detection of proliferating cell nuclear antigen (PCNA), a marker of cell proliferation.

Immunohistochemistry for Cell Proliferation

Sections of paraffin-embedded tissues were cut at 5 μm and placed on positively charged slides (Superfrost Plus, Fisher Scientific, Pittsburgh, PA) to ensure adhesion during processing for PCNA. Standard immunohistochemical methods were used to stain tissues for PCNA (PAI's SOP for immunohistochemistry). Briefly, tissue sections were incubated with a monoclonal antibody to PCNA (DAKO, lot #016, PAI No. A1723) and reagents required for the avidin-biotin

peroxidase (ABC Kit; PAI No. K 309 and K 321) method for the detection of the antigen-antibody complex. PCNA expression in cells in all phases of the cell cycle (G_1, S, G_2 and M) was localized by the chromagen 3,3'-diaminobenzidine (DAB; Sigma Chemical Co., lot #17H8927). Tissue sections were counterstained with hematoxylin.

Cell Proliferation Measurements

Positive staining for PCNA was categorized based on cellular distribution and intensity of the brown to black reaction product that correlated with the different phases of the cell cycle (Eldridge et al., 1993). Uniform, dark brown to black nuclear staining was judged to be positive for S phase cells. A cell in the G_1 phase of the cell cycle had diffuse, stippled nuclear staining that was lighter than a cell in S phase. Cells in the G_2 phase exhibited distinct, diffuse cytoplasmic stippling with or without nuclear staining. Mitotic figures were conspicuous with diffuse cytoplasmic stippling. The percentage of hepatocytes in each phase of the cell cycle (labeling index, LI) was determined by scoring at least 3000 hepatocytes in 10 randomly selected fields per animal. In addition, a proliferating index (PI; G_1+S+G_2+M phases combined) was determined and expressed as a percentage. A negative control slide was included in the staining run and consisted of study tissue that was not incubated with the primary antibody.

For cell proliferation evaluations, slides were first perused at low magnification (100X) to judge quality of staining, processing and sectioning, pattern of cell labeling (e.g., centrilobular or panlobular, extrahepatocellular proliferation, such as Kupffer cells, bile duct epithelium, endothelium), and histomorphologic changes. The later was further assessed by evaluating the serial H&E slide for each animal evaluated for cell proliferation. Cell proliferation was then quantified at higher magnification (200X) as described above.

Statistical Analysis

The Student's *t*-test (two-sided, unequal variance) was used to test for statistical significance in PI between control and treatment groups using Microsoft Excel version 5.0. A *P* value of 0.05 was judged to be statistically significant.

RESULTS

Cell Proliferation

Individual animal and group mean cell proliferation data are presented in Section II (Tables II-1 to III-4) and graphically in Section III (Figures III-1 and III-2. The percentage of proliferating hepatocytes (PI) was significantly increased only in male rats exposed to the highest dose of the test material at 4 weeks on study.

Histopathology

Sections from the same tissue blocks used for preparation of PCNA-stained slides were stained with hematoxylin and eosin (H&E) for histopathologic evaluation to facilitate the interpretation of the immunostained slides. Individual animal findings and group summaries are presented in Section IV.

Week 4 Findings

Histomorphologic evaluation revealed hepatocellular hypertrophy, central vein vasodilation, hematopoietic cell proliferation, and mononuclear cell infiltrates in the periductular connective tissue of the portal sections of the liver in all animals of all dose groups, including controls. The hepatocellular hypertrophy was characterized by enlargement of a single cell layer of hepatocytes around central veins in a centrilobular pattern and below the serosal surface of the livers. The cytoplasm of these enlarged cells was consistently foamy and/or lacy in appearance. The nuclei, however, appeared normal, in that no evidence of pyknosis, margination of chromatin, or other changes of nuclear degeneration were evident. Frequently, the veins around which these hepatocytes were located, were dilated and partially blood-filled. The livers of two male animals, C90984 and C91005, had narrow areas of focal necrosis extending from the serosal surface into the hepatocellular parenchyma. The centrilobular hepatocellular changes were considered to be associated with pentobarbital anesthesia.

Week 8 and 14 Findings

The results of histomorphologic evaluation showed hepatocellular hypertrophy in high-dose male rats and a subset of control male and female rats that were sacrificed at 8 weeks into the study. These changes were considered to be consistent with changes that occur with pentobarbital anesthesia, as seen in animals sacrificed at 4 weeks on study. The male and female animals from dose groups 2-4 and control animals from group 1 sacrificed at week 14 did not show these changes. The animals sacrificed at week 14 were euthanized under CO_2 anesthesia. Liver necrosis, ranging from focal to focally extensive, were noted in select animals from the male dose groups 4 (week 14) and 5 (week 8) and female dose group 5 (week 8). This change was not associated with concomitant significant inflammation, nor evidence of hepatocellular regeneration, suggestive of a lesion which occurred as a terminal event.

DISCUSSION

In the present study, cell proliferation was measured within the liver of male and female rats from control, low dose, mid dose, mid-high dose, and high dose test material after four, eight or 14 weeks on study to identify a NOEL for N-ethyl perfluorooctanesulfonamido ethanol based on a cell proliferation mode of action. A statistically significant increase in cell proliferation, as determined by the proliferating index (PI) was observed only in male rats from the high dose group after 4 weeks on study. This increase in PI was not observed after 8 weeks on study in the high dose male rats, nor in lower dose groups of male rats after 14 weeks on study. Cell proliferation was not statistically significant in female rats at 4, 8 or 14 weeks on study.

Although statistical analysis did not reveal a significant cell proliferative response to the test material, biological significance is evident in individual animals. Biological significance for an individual animal is defined as a doubling in PI over controls and greater than the highest control value. Thus, the data are presented in terms of severity (fold increase over controls) and incidence (number of animals showing biological significance). As seen in text table 1, biologically significant cell proliferation is evident in 2/5 male rats at the high dose and 1/5 male rats at the mid-high dose after 4 weeks on study, and in 2/4 male rats at the high dose after 8 weeks on study. Although 1 male rat exhibited a cell proliferative response at the mid-high dose after 4 weeks on study, this response was not sustained as evidenced by the lack of a response at week 14. Therefore, the NOEL in male rats is judged to be the mid-high dose. In contrast to male rats, biologically significant cell proliferation was not evident in female rats at any dose after 4 or 8 weeks on study, as seen in text table 2. Therefore, the NOEL in female rats is judged to be the high dose.

Text Table 1. Biologically Significant Cell Proliferation in Liver of Male Rats

Group	Week 4		Week 8 and 14[3]	
	Severity[1]	Incidence[2]	Severity[1]	Incidence[2]
Low dose	<1	0/5	<1	0/5
Mid dose	<1	0/5	<1	0/5
Mid-high dose	<1	1/5	<1	0/5
High dose	1.8	2/5	2.8	2/4

[1]Fold increase over controls

PCNA immunostaining has been reported to detect differential patterns of cell labeling in the liver of mitogen-treated rodents (Eldridge, et al., 1993). In the present study, the cell proliferative response observed in male rats was panlobular in that there was no distinct pattern of cell labeling. Furthermore, the increased proliferative response, as detected by PCNA immunostaining, was localized to hepatocytes. Interestingly, a rare pattern of PCNA-labeling was observed in high dose males and females, which was not seen in any other groups. The staining was characterized by a granular cytoplasmic staining pattern localized to the hepatocytes around central veins and below the serosal surface of the livers. Although histomorphologic evaluation revealed changes in these two areas within animals from all treatment groups, including controls, the PCNA-labeling pattern was observed only in animals from the high dose group. The significance of this type of labeling pattern is not know; however, it has been speculated that it may represent mitochondrial DNA synthesis (unpublished observation). Recently, it has been shown that PCNA can cross-react with peroxisomal multifunctional protein (Mayer, et al., 1998). Thus, it is likely that the centrilobular staining pattern observed in the high dose animals is associated with peroxisomes.

The centrilobular hepatocellular hypertrophy and vasodilation were consistent with alterations that occur with phenobarbital anesthesia and concomitant vasodilation and vascular pooling. The subserosal hepatocellular changes, which were cytologically identical to those seen in the centrilobular regions of the liver are suggestive of a response by hepatocytes to intraperitoneal administration of phenobarbital. Finally, the presence of hematopoietic cell proliferation and mononuclear cell infiltration into the portal regions of the liver are common findings in rodent livers and were considered to be incidental findings reflective of normal physiological events.

SUMMARY

The histopathologic changes seen after 4 weeks on study were observed in equal incidence and severity across dose groups, including controls. It is assumed that potential concomitant changes in cell proliferation are also equally represented among all groups. Therefore, cell proliferation effects at 4 weeks are judged to be related to test material, rather than due to phenobarbital anesthesia. Thus, based on the hepatocellular proliferation findings, the NOEL for N-ethyl perfluorooctanesulfonamido ethanol in liver of male and female rats is determined to be the mid-high dose and high dose, respectively.

IV. HISTOPATHOLOGY FINDINGS

Individual Animal Findings – Male Rats
Week 4 of Study

Animal Number	Dose Group	Sex	Histologic Findings
C90719	1	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90725	1	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90732	1	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90753	1	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90775	1	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90789	2	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild

C90814	2	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90817	2	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90833	2	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90834	2	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90846	3	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90853	3	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90866	3	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild

C90890	3	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90891	3	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90935	4	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90939	4	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90942	4	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90961	4	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C90966	4	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild

C90984	5	Male	Liver, necrosis, focal, mild Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91005	5	Male	Liver, necrosis, focal, mild Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91024	5	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91033	5	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91037	5	Male	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild

Individual Animal Findings – Female
Week 4 of Study

Animal Number	Dose Group	Sex	Histologic Findings
C91135	1	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91143	1	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91165	1	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91169	1	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91171	1	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91198	2	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild

C91205	2	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91222	2	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91230	2	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91237	2	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91251	3	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91272	3	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91285	3	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild

C91287	3	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91291	3	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91316	4	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91317	4	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91333	4	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91345	4	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91350	4	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild

C91423	5	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91427	5	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91430	5	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91443	5	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild
C91448	5	Female	Liver, centrilobular, hepatocellular hypertrophy, mild Liver, subserosa, hepatocellular hypertrophy, mild Liver, central vein, vasodilation Liver, portal, infiltration, mononuclear cell, mild Liver, hematopoietic cell proliferation, mild

Individual Animal Findings - Male Rats
Weeks 8 and 14 of Study

Animal Number	Dose Group	Week	Sex	Histologic Findings
C90717	1	8	Male	Liver, centrilobular, hepatocellular hypertrophy, mild

Cell Proliferation Report

104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats

Covance Study Number 6329-212

QUALITY ASSURANCE STATEMENT

This cell proliferation project has been inspected and audited by the PAI Quality Assurance Unit (QAU) as required by the Good Laboratory Practice (GLP) regulations promulgated by the U.S. Food and Drug Administration (FDA). The cell proliferation report is an accurate reflection of the recorded data. The following table is a record of the inspections/audits performed and reported by the QAU.

Date of Inspection	Phase Inspected	Date Findings Reported to Project Manger/ PAI Management	Date Findings Reported to Study Director/Study Director Management
03/16/98	Labeling (Slide/Block Match)	03/17/98	10/30/01
06/26,29,30/98	Study Data Supporting Documentation	06/30/98	10/30/01
06/26,29,30/98	Final Cell Proliferation Report	06/30/98	10/30/01
10/30/01	Amended Final Cell Proliferation Report	10/30/01	10/30/01

Study Title:	Transmission Electron Microscopy Evaluation of Liver Tissue in Rats. 104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats.
Date of Final Report:	October 10, 2001
Amendment:	Change Covance Study number from 6239-212 to the correct Study number of 6329-212 on the cover page and all the "Transmission Electron Micrograph Interpretation" forms found in Section III.
Reason for amendment:	Typographical error

Approvals:

SECTION I

PATHOLOGY NARRATIVE

Summary

Ten Crl:CD® (SD) IGS BR rats (five males and five females) were treated for 104 weeks with 100ppm of 98.1% n-ethyl perfluorooctanesulfonamido (NEtFOSE). Ten other rats of similar strain (five males and five females) were used as controls. Liver samples were obtained from each of the 20 rats during necropsy at terminal sacrifice for examination by transmission electron microscopy (TEM). Liver samples were assessed for changes that may likely occur due to chronic toxicity of the test material. Electron microscopic evaluation identified mild to moderate changes related to treatment. Mild to moderate smooth endoplasmic reticulum hyperplasia and minimal to mild hepatocellular hypertrophy were the prominent features found to be different between the mid-high dose group and control animals. Other changes included a slight increase in the amount of lipid accumulation and minor increases in lipofuscin were found in the treated animals compared with controls.

Procedure

The objective of this study was to examine ultrastructurally a sample of liver from 10 rats treated orally for 104-weeks with 100ppm of NEtFOSE. Hepatocytes were evaluated by TEM for changes that may be related to the test material. This study is part of a larger chronic toxicity study of NEtFOSE. This portion of the study included 10 treated rats (5 males and 5 females) and 10 control rats (5 males and 5 females). Treated rats were orally dosed daily for at least 104 weeks with 100ppm of NEtFOSE. The control rats were given the basal diet only. Terminal necropsies were performed on all 20 rats. Multiple tissues including liver were collected and preserved in 10% neutral-buffered formalin according to the study protocol. Additionally, samples of liver from each animal were thin-sliced, placed in 2% paraformaldehyde/2.5% glutaraldehyde in 0.1M phosphate buffer then subsequently processed and embedded in epoxy blocks for examination by TEM. Thin sections (approximately 90nm) from the epoxy blocks were cut, mounted on 200-mesh copper grids, stained with 5% methanolic uranyl acetate, and Reynold's lead citrate, then examined on a Zeiss EM10C transmission electron microscope. Both centrilobular and periportal hepatocytes were examined. Representative ultrastructural photomicrographs from each liver sample were taken and significant features were described and recorded for each micrograph, animal, and each group. The descriptive features of each rat were recorded on a transmission electron micrograph interpretation form. The number of peroxisomes per hepatocyte was manually counted then averaged for each animal. The average number of peroxisomes per group was tabulated.

Results

Micrograph interpretations for each rat can be found in section II. Representative micrographs of specific features are shown in section III as report figures. All remaining electron micrographs are separately attached to this report grouped according to rat number.

TEM evaluation

A total of 108 micrographs were evaluated. Fifty-four (54) micrographs represented the control group while fifty-four (54) micrographs represented the mid high-dose treated group. Ultrastructural findings for each group are summarized in Table 1. There was a minimal to mild increase in the size of hepatocytes in the treated group. Similarly, a mild to moderate increase in smooth endoplasmic reticulum (SER) and a slightly mild increase in lipid accumulation was also noted. The increase in the size of most hepatocytes was generally due to the increase in SER and possibly the lipid as well. SER is invariably affected during some types of hepatic toxicity, mostly toxicities that induce hepatic microsomal enzymes and lipid peroxidation (Cheville, 1994). Similarly, the increase in SER is regarded as an adaptive response by animals as a means to handle drug toxicities (Ghadially, 1997). Based on personal communication with the study pathologist, liver weights were increased and hepatocellular hypertrophy was diagnosed by light microscopy, which is consistent with ultrastructural findings of an increase in SER (Ghadially,

1997). One other minor feature that was prominent in a few treated rats was the accumulation of lysosomes that presumably contained lipofuscin pigment.
All control animals were considered normal. Although a small number of control rats had a mild increase in SER and a slight increase in the amount of lipid accumulation, the increases in SER and lipid accumulation in the treated animals was much more evident than in the control animals.

Table 2 summarizes the quantitation of peroxisomes for each group. Often, an increase in the number of peroxisomes indicates an alteration in liver cell physiology. However, in this study, there was no difference in the average number of peroxisomes between treated and untreated animals.

Table 1 Ultrastructural findings per animal

Animal no	Group[1]/Sex[2]	Comments
C90716	1/M	Normal hepatocytes.
C90722	1/M	Increased SER in 4/5[3] hepatocytes.
C90724	1/M	Normal hepatocytes.
C90726	1/M	Mild lipid accumulation.
C90728	1/M	Normal hepatocytes.
C90904	4/M	SER is increased. Hepatocellular hypertrophy in 4/6 hepatocytes. Moderate lipid accumulation.
C90908	4/M	Increased SER and lipid accumulation also.
C90926	4/M	Suboptimal fixation. Increased lysosomes most likely lipofuscin pigment.
C90927	4/M	SER is increased. One hepatocyte is hypertrophic.
C90928	4/M	SER is increased. Four out of six hepatocytes are hypertrophic.
C91127	1/F	Normal hepatocytes. Mild lipid accumulation.
C91131	1/F	Normal hepatocytes. Mild lipid accumulation.
C91144	1/F	Normal hepatocytes.
C91148	1/F	Normal hepatocytes.
C91159	1/F	Normal hepatocytes.
C91324	4/F	SER is increased. Both lipid and lysosomal accumulation appear slightly increased as well.
C91332	4/F	Mild increase in SER. A few lysosomes observed as well.
C91335	4/F	SER is increased. Three hepatocytes are slightly larger than normal.
C91336	4/F	SER is increased. One hepatocyte is slightly hypertrophic.
C91341	4/F	SER is increased.

[1]1=Control, 4=Mid-High dose group; [2]M=male, F=female; [3]ratio of abnormal hepatocytes per total number of hepatocytes described.

Table 2 Quantitation of Peroxisomes per rat[1]

Control Group				Treated Group			
Animal #	Male	Animal #	Female	Animal #	Male	Animal #	Female
C90716	11.3	C91127	10.8	C90904	7.3	C91324	8.5
C90722	20.0	C91131	10.8	C90908	9.7	C91332	8.7
C90724	22.5	C91144	12.8	C90926	6.3	C91335	12.4
C90726	15.0	C91148	11.5	C90927	12.0	C91336	10.4
C90728	15.0	C91159	11.0	C90928	11.0	C91341	9.8
Mean = 16.8		**Mean = 11.4**		**Mean = 9.3**		**Mean = 10.0**	

[1]The average number of hepatocytes counted per rat was 5.

Conclusion

An ultrastructural examination was done on liver samples from rats treated orally with 100ppm of NEtFOSE for a total of at least 104 weeks. Treatment related ultrastructural changes included a minimal to mild hepatocellular hypertrophy and a mild to moderate increase in SER. The amount of lipid accumulation was minimally increased in the treated animals.

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATIONS

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-212 EM 01.38

Species/Strain: Crl:CD® (SD) IGS BR

Animal No.: C90716

Tissue: Liver - Periportal

Treatment Group: 1 (Control)

Block No(s).: C90716-1A

Sex: Male

Photo/Negative No(s).: L6299-L6304

Significant Lesions (check one): _____ Yes __X__ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6299.** Liver. Hepatocyte. 7,530X. To the left side of the micrograph center, there is an oval shaped hepatocyte. The hepatocyte is somewhat smaller than normal. The nucleus is distinctly round and eccentrically positioned in the cell. The cytoplasm contains a number of small round mitochondria, patches of RER and SER. Eleven (11) peroxisomes are counted. A large sinusoid is found on the right side of the micrograph. Within this sinusoid are erythrocytes and some cellular debris. Some collagen fibrils are found in the upper right portion of this sinusoid. Other hepatocytes on this micrograph have similar characteristics as the described hepatocytes; however, a few have some small lipid droplets.
L6300. Liver. Hepatocyte. 7,530X. In this micrograph, a number of partial hepatocytes are observed. One whole hepatocyte is found in the center of the micrograph. This cell has an eccentrically located round nucleus. The cytosol contains mitochondria, SER, and less RER. Seven (7) peroxisomes are counted. Below this hepatocyte, there is a perisinusoidal fat storing cell (Ito cell). Randomly scattered are erythrocytes and a prominent endothelial cell in the upper left hand corner of the micrograph.
L6301. Liver. Hepatocyte. 10,200X. A dark staining, oval hepatocyte is observed in the center of the micrograph. There is a knife mark (artifact) running half way across the cell. The nucleus of this cell is somewhat oval with coarse clumped chromatin. The cytosol contains SER, RER, and mitochondria. Ten (10) peroxisomes are counted.
L6302. Liver. Hepatocyte. 7,920X. Portions of two oval hepatocytes running obliquely across the micrograph are observed. The hepatocyte located in the center of the micrograph is characterized by a smaller round nucleus. The cytoplasm of this cell is composed of areas of SER separating mitochondria and some small cisternae of RER. Thirteen (13) peroxisomes are counted. The hepatocyte above this cell has similar characteristics but with a large nucleus.
L6303. Liver. Hepatocyte. 7,920X. A polygonal-shaped hepatocyte is found in the center of five other hepatocytes. This cell has a large distinctly rounded, eccentrically located nucleus. The cytoplasm is filled with abundant RER, mitochondria, and some SER. Two small lipid droplets are observed also. Eleven (11) peroxisomes are counted. Of the hepatocytes surrounding this cell, two contain medium round lipid droplets.
L6304. Liver. Hepatocyte. 7,530X. In the center of the micrograph is an oblong-shaped hepatocyte. This cell has a small round nucleus. The cytoplasm contains numerous mitochondria, RER, and SER. A few small to medium sized lipid droplets and randomly scattered lysosomes are also observed. Sixteen (16) peroxisomes are counted. A knife mark is found running across the micrograph (artifact).

Conclusions: Normal hepatocytes. Peroxisome average is 11.3 per hepatocyte.

Sex: Male

Photo/Negative No(s).:L6208-L6212

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 26, 2001

Features: **L6208**. Liver. Hepatocyte. 10,200X. A somewhat cuboidal hepatocyte is found in the center of the micrograph. The hepatocyte has a distinctly rounded nucleus with a single nucleolus. The cytoplasm contains numerous mitochondria, RER, and SER. Twenty-five (25) peroxisomes are counted. Along the bottom right hand corner, there is a small amount of chatter artifact).
L6209. Liver. Hepatocyte. 10,200X. An oval hepatocyte is found in the center of the micrograph. The nucleus is round with a marginating nucleolus. The chromatin is finely granular. Within the cytosol, there are a number of mitochondria, RER, SER, and a few randomly scattered lipid droplets, some with myelin figures. Sixteen (16) peroxisomes are counted.
L6210. Liver. Hepatocyte. 10,200X. A large somewhat oval hepatocyte is found vertically centered on the micrograph. The hepatocyte has a small nucleus (plane of section) with dense coarse chromatin. The cytosol is filled with SER, patches of RER, and numerous mitochondria. Twenty-two (22) peroxisomes are counted. Along the bottom left hand corner of the micrograph, there is a cluster of large lipid droplets. In the upper right hand corner, there is a large sinusoid.
L6211. Liver. Hepatocyte. 10,200X. Approximately 90% of a hepatocyte is observed along the bottom right hand portion of the micrograph. There is a large area of chatter over the cytoplasm of this cell that makes interpretation somewhat difficult. The hepatocyte has a centrally located round nucleus. The cytosol of this cell is filled with numerous mitochondria, RER, and patches of SER. A few lipid droplets are also observed. Fifteen (15) peroxisomes are counted. Along the lower left hand edge, there is a large sinusoid containing a number of erythrocytes.
L6212. Liver. Hepatocyte. 7,920X. A somewhat oval hepatocyte is found in the center of the micrograph. The nucleus is distinctly round with a small nucleolus. The cytosol is filled with numerous slightly swollen mitochondria and a few randomly scattered lipid droplets. The RER is abundant and often slightly dilated. Twenty-two (22) peroxisomes are counted. The plasma membrane of the cell has numerous villous projections. Sinusoids on the upper left-hand side as well as the bottom of the micrograph contain a number of small erythrocytes. The bottom sinusoid also contains a leukocyte.

Conclusions: SER is increased in 4/5 hepatocytes. Peroxisome average is 20.0 per hepatocyte.

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-212 EM 01.38

Species/Strain: Crl:CD® (SD) IGS BR

Animal No.: C90724

Tissue: Liver- Periportal

Treatment Group: 1 (Control)

Block No(s).: C90724 1A

Sex: Male

Photo/Negative No(s).:L6213-L6217

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): [signature] March 26, 2001

Features: **L6213**. Liver. Hepatocyte. 7,530X. An oval hepatocyte is found horizontally in the center of the micrograph. A somewhat eccentrically located nucleus is compressed on one side due to a large lipid droplet. The nucleus contains a small nucleolus. The cytosol of this cell contains numerous small round mitochondria; some contain crystalline inclusions. Randomly scattered are patches of RER. Twenty (20) peroxisomes are counted. Above and below this cell, there are dilated sinusoids containing erythrocytes. Similar hepatocytes adjacent to this cell contain similar organelles.
L6214. Liver. Hepatocyte. 7,530X. A polygonal-shaped, centrally located hepatocyte contains two nuclei. One nucleus has a centrally located nucleolus. The cytosol of this cell contains numerous mitochondria and RER. A few randomly scattered glycogen particles are also observed. Twenty-seven (27) peroxisomes are counted.
L6215. Liver. Hepatocyte. 7,530X. In the center of the micrograph, there is a whole somewhat oval hepatocyte. This cell has a large round nucleus with a central nucleolus. The cytoplasm of the cell is filled with numerous mitochondria, and RER. Twenty-nine (29) peroxisomes are counted. The plasma membrane often contains a few small villous projections. Within a sinusoid running vertically along the left side of the micrograph, there is a cluster of erythrocytes and a plasma cell. A faint knife mark (artifact) is found along the right hand side of the hepatocyte.
L6216. Liver. Hepatocyte. 7,920X. A pyramidal-shaped hepatocyte is found in the center of the micrograph. The nucleus is large and rounded with a single nucleolus. The cytosol contains a number of mitochondria, RER and a few randomly scattered lysosomes. A small fragment of electron dense material (artifact) is found on the left side of the cell. Fourteen (14) peroxisomes are counted. The cell membrane is somewhat smooth with a few randomly scattered villous projections. Below this cell, there is a hepatocyte that contains a large cluster of lipid droplets. Above the hepatocyte, a wide sinusoid is found containing erythrocytes.

Conclusions: Normal hepatocytes. Peroxisome average is 22.5 per hepatocyte.

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): March 28, 2001

Features: **L6217**. Liver. Hepatocyte. 7,920X. In the center of the micrograph is a cuboidal-shaped hepatocyte. This cell has a nucleus with an irregular nuclear membrane. Within the cytoplasm, there are a number of lipid droplets, numerous mitochondria, and abundant RER. Thirteen (13) peroxisomes are counted. Adjacent hepatocytes also have a large number of lipid droplets.
L6218. Liver. Hepatocyte. 7,530X. This is a duplicate of the hepatocyte in micrograph **L6217.**
L6219. Liver. Hepatocyte. 7,530X. A pyramidal-shaped hepatocyte is located in the middle of the micrograph. The nucleus is distinctly rounded. The cytoplasm of this cell contains numerous mitochondria, RER, and lipid droplets. Seventeen (17) peroxisomes are counted. The cell membrane of an adjacent hepatocyte has a number of villous projections; these villi extend into the large sinusoid at the bottom left hand corner of the micrograph. This sinusoid contains erythrocytes and a single leukocyte.
L6220. Liver. Hepatocyte. 7,920X. A large cuboidal hepatocyte is found in the upper half of the micrograph. The cell contains a large nucleus with an irregular nuclear membrane. A small nucleolus is observed in the nucleus. The cytosol of this cell is filled with RER, mitochondria, some glycogen particles, and a small cluster of lipid droplets. A small sinusoid in the lower right hand corner of the micrograph contains a small leukocyte, as does the one in the upper right hand corner. Thirteen (13) peroxisomes are counted.
L6221. Liver. Hepatocyte. 7,920X. A somewhat rounded hepatocyte is found in the middle of the micrograph. The cell has a centrally located distinctly rounded nucleus. The cytoplasm is filled with a number of large lipid droplets, abundant mitochondria, and RER. Twenty (20) peroxisomes are counted. Bordering this hepatocyte are other hepatocytes with similar characteristics. In the lower left hand corner of the micrograph, there is a portion of a leukocyte within a sinusoid.
L6222. Liver. Hepatocyte. 7,530X. This is a duplicate of the hepatocyte in **L6220.**
L6223. Liver. Hepatocyte. 7,530X. A round hepatocyte is observed in the center of the micrograph. The cell has two nuclear profiles, one is irregular-shaped due to a number of variable-sized lipid droplets compressing the nuclear membrane; the other nucleus is smaller and somewhat rounded. The cytoplasm contains a number of small mitochondria and RER. A few lysosomes are also observed. Twelve (12) peroxisomes are counted. Along the lower right corner of the micrograph in a sinusoid, there is a somewhat oval cell filled with large lipid droplets (Ito cell).

Conclusions: Mild lipid accumulation. Peroxisome average is 15.0 per hepatocyte.

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): [signature] March 27, 2001

Features: **L6224**. Liver. Hepatocyte. 4,990X. This micrograph contains hepatocytes surrounded by two sinusoids; one containing an Ito cell (upper right) and a lymphocyte (lower left). Between these sinusoids, there are two hepatocytes side by side. The hepatocyte on the right contains a rounded nucleus with one nucleolus. The cytoplasm of this cell is filled with mitochondria, RER, and some SER. Four lipid droplets are also observed. Eleven (11) peroxisomes are counted.
L6225. Liver. Hepatocyte. 10,200X. Approximately 90% of an oval hepatocyte is observed in the middle of the micrograph. The cell is characterized by a distinctly round nucleus having a centrally located nucleolus. Within the cytosol, there are a number of mitochondria, RER, and SER. Thirteen (13) peroxisomes are counted. The cell membrane contains numerous villous projections.
L6226. Liver. Hepatocyte. 7,920X. A round hepatocyte is located in the center of the micrograph. This cell contains a large round nucleus with a central nucleolus. The cytoplasm of this hepatocyte contains a large number of mitochondria, some RER, and a few lysosomes and lipid droplets. Eighteen (18) peroxisomes are counted. An Ito cell, is found at the bottom of the micrograph and is characterized by cytoplasm filled with large lipid droplets.
L6227. Liver. Hepatocyte. 10,200X. A somewhat round hepatocyte is found in the center of the micrograph. The cell has an eccentrically located nucleus with finely granular chromatin. Within the cytosol, there are a few patches of RER, a moderate number of mitochondria, and abundant SER. A few small lysosomes and two somewhat small lipid droplets are also observed. Sixteen (16) peroxisomes are counted. Two bile canaliculi are observed between this hepatocyte and the adjacent hepatocytes on the left of the micrograph. In the upper right hand corner of the micrograph, a sinusoid is observed containing two partial erythrocytes.
L6228. Liver. Hepatocyte. 7,920X. A cuboidal shaped hepatocyte is found in the center of the micrograph. The cell has a centrally located nucleus. The cytosol contains numerous small mitochondria, RER, SER, and a cluster of small lysosomes. Small to moderate sized lipid droplets are also observed. Seventeen (17) peroxisomes are observed.

Conclusions: Normal hepatocytes. Peroxisome average is 15.0 per hepatocyte.

Sex: Male Photo/Negative No(s).: L6229-L6233

Significant Lesions (check one): X Yes ____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6229.** Liver. Hepatocyte. 7,530X. Approximately 90% of a large round hepatocyte is observed in the center of the micrograph. The nucleus is round with finely granular chromatin. The cytoplasm is filled with SER and minimal numbers of mitochondria, and even less RER. In addition to the SER, there are a number of variable to medium sized lipid droplets. Seven (7) peroxisomes are counted.
L6230. Liver. Hepatocyte. 4,990X. A large (compared to other hepatocytes at this magnification) polygonal-shaped hepatocyte is found in the center of the micrograph. The nucleus is small and round. The cytoplasm is extremely dark and filled with a large number of small to medium sized lipid droplets. In addition to the lipid, there is an abundant amount of SER and mitochondria. Peroxisomes not counted due to the dark staining of the cell. The adjoining hepatocytes also are dark staining with abundant SER and large number of lipid droplets.
L6231. Liver. Hepatocyte. 4,990X. Similar to the hepatocyte in **L6230,** this cell is larger than normal (compared with comparable control hepatocytes of similar magnification). The cell contains two nuclei (plane of section, assumed only one), one nucleus is large with a prominent nucleolus and a smaller nucleus with no nucleolus. The cytoplasm is distended with abundant SER, and numerous small to large lipid droplets. RER and mitochondria are also observed. Six (6) peroxisomes are counted. Bordering hepatocytes are also filled with numerous lipid droplets.
L6232. Liver. Hepatocyte. 4,990X. Another large oblong hepatocyte (compared to similar control hepatocytes). This cell has two nuclei, one smaller than the other. The cytoplasm is filled with abundant SER, RER, and numerous small lipid droplets. One large electron dense lipid droplet is observed. Mitochondria and a few small stacks of RER are observed as well. Nine (9) peroxisomes are counted. In the lower right hand corner of the micrograph, there is another hepatocyte that also contains a large number of lipid droplets.
L6233. Liver. Hepatocyte. 4,990X. The cytoplasm of a hepatocyte is found in the center of the micrograph. The cytoplasm is extremely dilated due to a large number of small, medium, and a few large lipid droplets. Peroxisomes not counted.

Conclusions: Hepatocellular hypertrophy in 4/6 hepatocytes. SER is increased as well as moderate lipid accumulation. Peroxisome average is 7.3 per hepatocyte.

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6305.** Liver. Hepatocyte. 10,200X. A somewhat round hepatocyte is located in the center of the micrograph. This cell contains a round nucleus with coarse chromatin. The cytoplasm is filled with abundant SER, and fewer mitochondria and RER. In addition to the SER, there are small to medium sized lipid droplets. Six (6) peroxisomes are counted. Surrounding this cell are wide sinusoids filled with clumped erythrocytes.
L6306. Liver. Hepatocyte. 7,920X. An oval hepatocyte is found vertically positioned in the center of the micrograph. The cell has an eccentrically located nucleus with coarse chromatin. The cytoplasm contains numerous mitochondria, patches of SER, and less but prominent RER. In addition, there are a few lipid droplets as well. Ten (10) peroxisomes are counted.
L6307. Liver. Hepatocyte. 7,920X. A cuboidal-shaped hepatocyte is found obliquely positioned in the center of the micrograph. This cell has a somewhat small nucleus with coarse chromatin. The cytoplasm contains numerous mitochondria, RER, some SER, and a few lipid droplets and an even smaller number of lysosomes. Eleven (11) peroxisomes are counted. A clump of electron dense debris is found along the edge of the cell (artifact). In the left hand corner of the micrograph, there is a clump of erythrocytes. A dilated bile canaliculus is found near the bottom on the left of the micrograph.
L6308. Liver. Hepatocyte. 7,530X. A round hepatocyte is observed in the center of the micrograph. This cell has two nuclei, one is slightly indented due to a large lipid droplet while the other is somewhat rounded. The cytoplasm contains a number of mitochondria, SER, RER, and a few medium sized lipid droplets. Ten (10) peroxisomes are counted. Similarly, hepatocytes surrounding this cell also contain medium to large lipid droplets. A clump of erythrocytes and lipid droplets are observed in a sinusoid in the bottom left corner of the micrograph. The dark staining of the upper left and the lighter staining of the lower right of the micrograph are considered staining artifacts.
L6309. Liver. Hepatocyte. 7,920X. An oblong-shaped hepatocyte is found obliquely positioned in the center of the micrograph. The cell contains a somewhat cuboidal-shaped nucleus with an irregular nuclear membrane. Numerous mitochondria, RER, and SER are found in the cytosol. In addition, numerous variable-sized, mostly medium, lipid droplets are also observed. Twelve (12) peroxisomes are counted.
L6310. Liver. Hepatocyte. 7,920X. A slightly rounded, dark staining hepatocyte is observed to the left of the micrograph center. The cell is characterized by a somewhat rounded nucleus and cytoplasm with mitochondria, RER, SER, and a few small to medium lipid droplets and 4 lysosomes. Nine (9) peroxisomes are counted. The hepatocyte to the upper left of this cell contains a small number of lysosomes. To the right of this cell, there are three elongated bundles of collagen. A number of clumped erythrocytes are found to the right and below this cell.

Conclusions: SER is increased in 5/6 hepatocytes. Lipid accumulation appears increased as well. Peroxisome average is 9.7 per hepatocyte.

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-212 EM 01.38

Species/Strain: Crl:CD® (SD) IGS BR

Animal No.: C90926

Tissue: Liver -Periportal

Treatment Group: 4 (Mid-high 100ppm NEtFOSE)

Block No(s).: C90926 1A

Sex: Male

Photo/Negative No(s).: L6234-L6239

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6234.** Liver. Hepatocyte. 7,530X. A somewhat oval hepatocyte is found in the center of the micrograph. The nucleus is eccentrically located, somewhat rounded with an irregular undulating nuclear membrane. There is a single large nucleolus in the center of the nucleus. The cytosol contains numerous mitochondria, RER, and a large patch of SER. There are a few, 5, lipid droplets and a few small lysosomes. Six (6) peroxisomes are counted. Surrounding this cell are sinusoids containing erythrocytes, and cellular debris. Part of a hepatocyte with similar characteristics is observed in the lower left hand corner.
L6235. Liver. Hepatocyte. 7,530X. A vertically positioned, oval hepatocyte is found in the center of the micrograph. On the right of the cell, the plasma membrane is difficult to discern. The nucleus of this cell is slightly round with an irregular nuclear membrane. The cytoplasm contains a dense accumulation of SER along the top, and mitochondria and RER scattered randomly throughout the cell. A small cluster of lysosomes is found at the bottom of the cell. Seven (7) peroxisomes are counted. Surrounding this cell, the perisinusoidal space is filled with cellular debris, and an erythrocyte. A binucleated hepatocyte is found along the bottom left with similar characteristics as the one described while another hepatocyte at the top left hand corner contains lysosomes in addition to mitochondria and RER.
L6236 (7,530X) and L6237 (4,990X). Liver. Hepatocellular debris. Micrograph is uninterruptible due to less than optimal fixation that causes difficulty in determining individual cell borders. There is an increase in the amount of residual bodies, presumed to be most likely lipofuscin deposits.
L6238. Liver. Hepatocyte. 4,990X. An oblong-shaped hepatocyte is found in the center of this micrograph. The central cell is characterized by an eccentrically located nucleus with a large round nucleolus. The cytosol contains abundant RER and mitochondria. Six (6) peroxisomes are counted. Above and to the right of this cell, there are a number of large lipid droplets that appear to be within the sinusoids. Two somewhat large round electron dense residual bodies are found on the left side of the micrograph and below the cell described.
L6239. Liver. Hepatocyte. 4,990X. A portion of a hepatocyte containing large lipid droplets. Based on the magnification, these droplets are extremely large.

Conclusions: Due to suboptimal fixation, cell morphology was difficult to interpret. There was evidence of an increase in lysosomes most likely lipofuscin pigment. Peroxisome average is 6.3 per hepatocyte.

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6240.** Liver. Hepatocyte. 7,920X. A cuboidal-shaped hepatocyte is found in the center of the micrograph. The cell has a very small nucleus (sectioning artifact). The cytoplasm contains a large amount of SER, RER, and mitochondria. A few lysosomes and lipid droplets are found randomly scattered within the cell. Fourteen (14) peroxisomes are counted. Other hepatocytes surrounding this cell have similar characteristics.
L6241. Liver. Hepatocyte. 7,520X. Off to the center right is approximately 90% of a hepatocyte. The nucleus of this cell is eccentrically located with a small nucleolus. The cytoplasm is filled with numerous small round mitochondria, RER, and SER. A few lipid droplets are also observed. Nine (9) peroxisomes are counted. A sinusoid with two erythrocytes, and a phagocytic cell (Kupffer cell) is found along the left side of the micrograph. The other hepatocytes in the micrograph have similar characteristics as the cell described.
L6242. Liver. Hepatocyte. 7,530X. A large oval hepatocyte is found encompassing almost all of the micrograph. The nucleus is eccentrically located with finely granular chromatin. The cytoplasm is distended with numerous mitochondria, RER, and abundant SER. Twenty (20) peroxisomes are counted. A leukocyte and two erythrocytes are found in a sinusoid at the left hand side of the micrograph. A circular deposit of electron dense material (artifact) is found in right top corner.
L6243. Liver. Hepatocyte. 7,530X. A round hepatocyte is found in the center of the micrograph. This cell has a somewhat eccentrically located round nucleus. The cytosol contains abundant mitochondria, RER, and SER. A few lipid vacuoles are also observed. Ten (10) peroxisomes are counted. Hepatocytes surrounding this cell also have similar characteristics.
L6244. Liver. Hepatocyte. 7,530X. An oval shaped hepatocyte is located vertically in the center of the micrograph. The cell has a large round nucleus with one prominent nucleolus. The cytoplasm contains a number of mitochondria, RER, and some SER randomly scattered between mitochondria and lipid droplets. Seven (7) peroxisomes are counted. The plasma membrane on the right side of the cell is characterized by numerous microvillous projections. A clump of erythrocytes is found in the upper left hand corner of the micrograph.

Conclusions: SER is increased. One hepatocyte is hypertrophic. Peroxisome average is 12.0 per hepatocyte.

Significant Lesions (check one): X Yes ____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6245.** Liver. Hepatocyte. 7,530X. A somewhat larger hepatocyte is observed horizontally positioned in the middle of the micrograph. The cell has a large round nucleus with a large nucleolus. The cytoplasm is filled with SER, mitochondria, RER, and a number of small to medium sized lipid droplets. Eight (8) peroxisomes are counted. Bordering hepatocytes also have lipid droplets and increased SER. Tissue folds (electron dense lines over the entire micrograph) are artifacts.

L6246. Liver. Hepatocyte. 7,530X. A rather large hepatocyte (encompassing almost the entire micrograph) is found in the center of the micrograph. The cell has two nuclei, one small and one large (sectioning artifact). Within the cytoplasm, there is an abundance of SER separating small mitochondria and individual cisternae of RER. Lipid droplets are found scattered along the outer periphery of the cell. Fifteen (15) peroxisomes are counted. There is an increase in the amount of electron dense cellular debris on the micrograph (artifact).

L6247. Liver. Hepatocyte. 7,530X. In the center of the micrograph, there is approximately 90% of a single hepatocyte observed. This cell has a large central nucleus with a large nucleolus. The cytoplasm is filled with SER, RER, and small round mitochondria. A cluster of lipid is found on the right side of this cell as well as in the hepatocyte below. Fifteen (15) peroxisomes are observed. Tissue folds and staining artifact is present over the entire micrograph.

L6248. Liver. Hepatocyte. 7,920X. A slightly larger cell is found in the center of the micrograph. The nucleus is small and centrally located. The cytoplasm is filled with loosely packed SER, RER, and widely space mitochondria. A few medium sized lipid droplets are also observed. Ten (10) peroxisomes are counted. Similar to the other micrograph, staining artifact is scattered over the entire micrograph.

L6249. Liver. Hepatocyte. 7,920X. Approximately 90% of a hepatocyte is found in the middle of the micrograph. The nucleus of this cell is distinctly round and large. The cytoplasm contains abundant SER, RER, and mitochondria. Seven (7) peroxisomes are counted. Bordering hepatocytes contain similar characteristics but with slightly more lipid.

L6250. Liver. Hepatocyte. 12,100X. High magnification of the cytoplasm of a hepatocyte. Within the cytoplasm, there are a number of mitochondria, wide spaced cisternae of RER, and SER. Staining artifact is also present on this micrograph. Peroxisomes not counted.

Conclusions: SER is increased. Four out of six hepatocytes are hypertrophic. Peroxisome average is 11.0 per hepatocyte.

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): C A Cummings March 27, 2001

Features: L6251. Liver. Hepatocyte. 7,530X. In the middle of the micrograph, positioned somewhat horizontally there is an oval hepatocyte. This cell has a large indented nucleus with an eccentric nucleolus. In the cytosol, there are two large lipid droplets, numerous mitochondria, and RER. SER, and a few small lysosomes are also found. Thirteen (13) peroxisomes are counted. Above the hepatocyte, there is a sinusoid lined by a prominent endothelial cell. Another hepatocyte in the upper left hand corner that contains a large lipid droplet while another hepatocyte on the bottom of the micrograph also has a large lipid droplet.
L6252. Liver. Hepatocyte. 7,530X. Approximately 90% of one hepatocyte is found in the center of the micrograph. This cell is characterized by an eccentrically large round nucleus with a prominent nucleolus. The cytosol contains numerous mitochondria, randomly scattered RER, and a few lipid droplets. Eleven (11) peroxisomes are counted.
L6253. Liver. Hepatocyte. 7,530X. A small hepatocyte in the center of the micrograph is slightly compressed on the right by a large lipid droplet. The central hepatocyte has an eccentrically located nucleus with a prominent nucleolus. Within the cytosol of this cell, there is one large lipid droplet, loosely scattered mitochondria, and scant RER. Eleven (11) peroxisomes are counted.
L6254. Liver. Hepatocyte. 7,530X. A polygonal hepatocyte is found to the left of the micrograph center. The cell membrane is irregular with microvilli. The cell has a large distinctly round nucleus with a marginating nucleolus. The cytosol is filled with numerous round mitochondria, RER, and a medium sized lipid droplet. Below this cell, there are multiple large lipid droplets, one is found along the bottom right of the micrograph. Eight (8) peroxisomes are counted.
L6255. Liver. Hepatocyte. 7,530X. An oval hepatocyte is found vertically positioned in the center of the micrograph. This cell has a large somewhat rounded nucleus with a single nucleolus. The cytoplasm contains a number of mitochondria, abundant RER, and randomly scattered patches of SER with associated glycogen. Four lipid droplets are also observed. Seven (7) peroxisomes are counted. Surrounding this hepatocyte, there are other hepatocytes that contain large lipid droplets, especially prominent in the upper left hand corner. SER in the other hepatocytes appear dilated. A large prominent endothelial cell is found lining the sinusoid in the upper right hand portion of the micrograph.
L6256. Liver. Hepatocyte. 7,530X. A pyramidal-shaped hepatocyte is found in the center of the micrograph. The cell has two round nuclei, one has a large prominent nucleolus and the other has none (possibly plane of section). The cytosol of this cell contains numerous mitochondria, RER, and patches of loosely arranged glycogen. Four large lipid droplets are also observed. Fifteen (15) peroxisomes are counted.

Conclusions: Normal hepatocytes. Mild lipid accumulation. Peroxisome average is 10.8 per hepatocyte.

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): [signature] March 27, 2001

Features: **L6257**. Liver. Hepatocyte. 7,530X. A somewhat oval hepatocyte is found centered on the micrograph. The cell is characterized by a somewhat oval nucleus with a prominent marginating nucleolus and a cytoplasm filled with numerous mitochondria, RER, and a number of large lipid droplets. Some of the lipid droplets contain cellular debris. A few randomly scattered lysosomes and glycogen particles are also observed. Ten (10) peroxisomes are counted. Surrounding this hepatocyte is a dilated sinusoid lined by prominent endothelial cells and containing a number of clumped erythrocytes and along the bottom of the micrograph, a perisinusoidal lipid-laden fat storing cell (Ito cell).
L6258. Liver. Hepatocyte. 7,530X. A polygonal-shaped hepatocyte is found in the center of the micrograph. This cell has a small nucleus (sectioning artifact). The cytoplasm is distended with loosely arranged mitochondria, RER, and a large number of lipid droplets. A number of these droplets contain debris. Twelve (12) peroxisomes are counted. Surrounding this hepatocyte on all sides are dilated sinusoids with erythrocytes. A large perisinusoidal fat storing cell (Ito cell) is observed on the bottom of the micrograph.
L6259. Liver. Hepatocyte - perisinusoidal space. 10,200X. Within a dilated sinusoid, there is a cell (presumed phagocytic, Kupffer cell) filled with large lysosomes and a few dilated RER cisternae. Also within this sinusoid are a few erythrocytes, and a perisinusoidal fat storing cell (Ito cell) located in the left bottom corner of the micrograph. The microvillous border and the endothelial cell lining is quite prominent as is the space of Disse. Portions of hepatocytes found lining the outer edge of this sinusoid are dark and filled with lipid droplets and mitochondria. No peroxisomes are counted.
L6260. Liver. Hepatocyte. 7,530X. A centrally located binucleated hepatocyte is observed. The cytosol contains randomly scattered mitochondria, separated by SER, dilated cisternae of RER, and a few small lysosomes and medium sized lipid droplets. Ten (10) peroxisomes are counted. A prominent perisinusoidal fat storing cell (Ito cell) is found in the upper left hand corner of the micrograph. Hepatocytes bordering the bottom half of the micrograph also contain lipid droplets.
L6261. Liver. Hepatocyte. 7,530X. Two prominent oval hepatocytes are found side by side in the center of the micrograph. The hepatocyte on the left has a distinctly round somewhat eccentrically nucleus. The cytoplasm contains numerous stacks of RER, lesser SER, and a number of small round to elongate and slender mitochondria. Medium-sized lipid droplets are also observed. Fourteen (14) peroxisomes are counted. Located in the upper right hand corner of the micrograph is a perisinusoidal fat storing cell that is somewhat compressing both hepatocytes.
L6262. Liver. Hepatocyte. 7,530X. A somewhat cuboidal hepatocyte is found in the center of the micrograph. This cell has a large round nucleus with a marginating nucleolus. The cytosol contains a number of mitochondria, often clumped together and compressed due to large lipid droplets. A number of lipid droplets are observed. RER and SER as well as a few small lysosomes are also observed. Eight (8) peroxisomes are counted.

Conclusions: Normal hepatocytes. Mild lipid accumulation. Peroxisome average is 10.8 per hepatocyte.

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6263**. Liver. Hepatocyte. 7,530X. A round hepatocyte is found in the center of the micrograph. The centrally located nucleus has an irregular nuclear membrane. The nucleus contains one large eccentrically located nucleolus. There are numerous mitochondria characterized by pale dilated cristae. Large cisternae of RER are found as well as a few small randomly scattered lysosomes. A few lipid droplets are found along the periphery of the cell. Fifteen (15) peroxisomes are counted.

L6264. Liver. Hepatocyte. 7,530X. In the center of the micrograph, there is a round hepatocyte with a somewhat rounded nucleus. The cytosol is filled with abundant RER and mitochondria. A few large lipid droplets and a few small lysosomes are also observed. Thirteen (13) peroxisomes are counted. This cell is bordered by other hepatocytes with similar characteristics. Along the bottom of the micrograph, there is a sinusoid containing a leukocyte. The endothelial cell lining the right side of this sinusoid is also observed.

L6265. Liver. Hepatocyte. 7,920X. An oval hepatocyte is centered horizontally on the micrograph. This cell has an irregularly rounded nucleus with a somewhat marginating nucleolus. The cytoplasm of the cell is filled with RER, mitochondria, a few variable-sized lipid droplets, and randomly scattered small patches of SER. Thirteen (13) peroxisomes are counted. The cell membrane contains a number of microvillous projections that extend into the surrounding sinusoids.

L6266. Liver. Hepatocyte. 7,530X. In the center of the micrograph is a somewhat pyramidal-shaped hepatocyte. This hepatocyte has a centrally located round nucleus with a prominent eccentrically located nucleolus. The cytoplasm is filled with RER, SER, and numerous mitochondria. Lipid droplets, and a few small lysosomes are also observed. Twelve (12) peroxisomes are counted. A few tissue fissures are observed along the left side of the micrograph (sectioning artifact).

L6267. Liver. Hepatocyte. 7,920X. A polygonal shaped hepatocyte is found in the center of the micrograph. The cell has a large slightly cuboidal nucleus with a large round prominent nucleolus. Numerous mitochondria and stacks of RER are found within the cytosol. A few variable sized lipid droplets and a few lysosomes are also observed. Eleven (11) peroxisomes are counted. In the top right hand corner of the micrograph, there are some clumped erythrocytes. In the lower right hand corner, there is a dilated sinusoid lined by prominent endothelial cells.

Conclusions: Normal hepatocytes. Peroxisome average is 12.8 per hepatocyte.

Significant Lesions (check one): _____ Yes X No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6268.** Liver. Hepatocyte. 4,990X. A polygonal-shaped hepatocyte is found vertically located in the center of the micrograph. This hepatocyte has a large oval nucleus with four prominent nucleoli. The cytoplasm contains abundant RER, some SER, and a few lipid droplets along the outer periphery of the cell. Mitochondria are small and mild to moderately pleomorphic. Seven (7) peroxisomes are counted. The hepatocyte is surrounded by a dilated sinusoids filled with erythrocytes and some cellular debris.

L6269. Liver. Hepatocyte. 7,920X. A somewhat rounded hepatocyte is found in the center of the micrograph. The cell has a large oval nucleus with a prominent nucleolus. The cytosol contains numerous mitochondria, RER, less SER, and a few lipid droplets. Thirteen (13) peroxisomes are counted. A hepatocyte in the upper left hand corner of the micrograph has similar characteristics as the central hepatocyte.

L6270. Liver. Hepatocyte. 7,530X. A cuboidal-shaped hepatocyte is found in the center of the micrograph. The cell has an eccentrically located nucleus with a prominent nucleolus. The cytoplasm is filled with numerous somewhat dilated cisternae of RER, a number of pale staining mitochondria, and two large lipid droplets. Twelve (12) peroxisomes are counted.

L6271. Liver. Hepatocyte – sinusoid. 7,920X. A perisinusoidal fat storing cell (Ito cell) is located in the lower half of the micrograph. A large somewhat flat endothelial cell is observed in the center of the micrograph containing a large vacuole containing cellular debris and smaller, randomly scattered, vesicles. Hepatocytes located above and below this sinusoid are not described. Peroxisomes not counted.

L6272. Liver. Hepatocyte. 7,530X. An oval hepatocyte in the center of the micrograph is somewhat smaller than normal. The nucleus is round with an irregular undulating nuclear membrane. The cytoplasm is filled with large dilated endoplasmic reticulum. The micrograph is somewhat pale and the type of endoplasmic reticulum is presumed smooth. Interwoven with the SER are numerous mitochondria with prominent dilated lamellar cristae. Peroxisomes not counted.

L6273. Liver. Hepatocyte. 7,920X. A large polygonal-shaped hepatocyte is found in the center of the micrograph. The nucleus of this cell is round with a marginating nucleolus. The cytoplasm contains a number of mitochondria separated by large cisternae of RER and patches of SER. A few lipid droplets, some with cellular debris, are also observed. Fourteen (14) peroxisomes are counted. Clumps of erythrocytes are found long the upper left and right hand borders of the micrograph.

Conclusions: Normal hepatocytes. Peroxisome average is 11.5 per hepatocyte.

THIS PAGE REVISED.

Significant Lesions (check one): _____ Yes __X__ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6274.** Liver. Hepatocyte. 7,530X. A polygonal-shaped hepatocyte is found in the center of the micrograph. The cell has a small round nucleus with an irregular nuclear membrane. The cytosol is distended with large numbers of mitochondria, abundant RER, a lesser SER. Also observed are a number of small to medium-sized lipid droplets. Eleven (11) peroxisomes are counted. A few small lysosomes are also found randomly scattered within the cytosol. Above this hepatocyte, there is a large sinusoid filled with erythrocytes and a small perisinusoidal fat storing cell (Ito cell)

L6275. Liver. Hepatocyte. 7,920X. A polygonal-shaped hepatocyte is found in the center of the micrograph surrounded on four sides by other hepatocytes with similar characteristics. A large sinusoid is found at the bottom of the micrograph. Microvilli on the cell membrane of the central hepatocyte are found projecting into the lumen of the sinusoid. The central hepatocyte is characterized by a bean-shaped nucleus. The cytoplasm is filled with SER, RER, and numerous mitochondria. Ten (10) peroxisomes are counted.

L6276. Liver. Hepatocyte. 7,920X. A somewhat rounded hepatocyte with a distinctly rounded nucleus is found in the center of the micrograph. The nucleus has a large round nucleolus. Within the cytosol, there are a number of similar-sized mitochondria, RER, and SER. Ten (10) peroxisomes are counted. A large clump of erythrocytes is found in the upper left hand corner of the micrograph.

L6277. Liver. Hepatocyte. 7,530X. Approximately 95% of an oval cell is observed in the center of the micrograph. The nucleus is distinctly rounded and the cytoplasm is filled with mitochondria and RER. A few small patches of SER are also observed. Thirteen (13) peroxisomes are counted. Four other hepatocytes are found surrounding this hepatocyte along the bottom and right side of the micrograph; these cells have similar characteristics as the cell described.

L6278. Liver. Hepatocyte. 7,920X. A polygonal-shaped hepatocyte is observed in the center of the micrograph. The nucleus is distinctly rounded with a prominent nucleolus and a less prominent area of clumped chromatin. The cytoplasm is filled with mitochondria separated by SER and RER. Eleven (11) peroxisomes are counted.

Conclusions: Normal hepatocytes. Peroxisome average is 11.0 per hepatocyte.

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6279.** Liver. Hepatocyte. 7,530X. An oval-shaped hepatocyte is observed in the center of the micrograph. The cell has a distinctly round nucleus with two small prominent nucleoli. The cytoplasm contains numerous mitochondria, RER, and SER. Small to medium sized lipid droplets are also observed. Thirteen (13) peroxisomes are counted. The plasma membrane of the cell has numerous microvillous projections. Surrounding this cell, the sinusoids contain a large amount of cellular debris. A hepatocyte in the left hand lower corner has similar morphologic characteristics as the cell described.
L6280. Liver. Hepatocyte. 7,920X. A somewhat round hepatocyte is found in the middle of the micrograph. The cell has a large round nucleus with an irregular nuclear membrane. Within the nucleus, there are two prominent nucleoli. The cytoplasm is filled with streams of RER, numerous mitochondria, and an increase in SER. A few lipid droplets are also observed; some have small myelin figures. Eight (8) peroxisomes are counted. The bordering hepatocytes have a similar increase in SER and a number of lipid droplets. Along the right hand side of the micrograph, there is a phagocytic cell containing electron dense material (lipofuscin).
L6281. Liver. Hepatocyte. 7,920X. The micrograph is dark that makes interpretation difficult. A large binucleated hepatocyte is located along the left hand side of the micrograph. The nuclei are round; one has a prominent nucleolus. The cytoplasm is filled with abundant SER, and less RER and mitochondria. Small and medium sized lipid droplets are also observed. Six (6) peroxisomes are counted. On the lower right hand side of the micrograph, there is a portion of another hepatocyte that contains three large lipid droplets.
L6282. Liver. Hepatocyte. 4,990X. A cuboidal-shaped hepatocyte is located somewhat in the middle of the micrograph. This cell has a small round nucleus and abundant cytoplasm. Within the cytoplasm, there is an increase in SER, RER, and mitochondria. A few small and medium sized lipid droplets are also observed. Seven (7) peroxisomes are counted. There are a number of small lysosomes in the cytoplasm as well. Additionally, the hepatocyte in the left hand corner also contains small lysosomes.
L6283. Liver. Hepatocyte. 7,530X. A pyramidal-shaped hepatocyte is found in the center of the micrograph on top of another hepatocyte. The pyramidal cell has an eccentrically located, round, nucleus. The cytoplasm is filled with mitochondria, RER, and a few patches of SER. A number of medium and some small lipid droplets along with a few small lysosomes are also observed. The hepatocyte below this cell also contains small lipid droplets and an increase in SER. The sinusoid on the right side of the micrograph contains three erythrocytes. Peroxisomes are not counted due to the darkness of the cytoplasm.

Conclusions: SER is increased. Both lipid and lysosomal accumulation appear slightly increased as well. Peroxisome average is 8.5 per hepatocyte.

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-212 EM 01.38

Species/Strain: Crl:CD® (SD) IGS BR

Animal No.: C91332

Tissue: Liver - Periportal

Treatment Group: 4 (Mid-high 100ppm NEtFOSE)

Block No(s).: C91332 1A

Sex: Female

Photo/Negative No(s).: L6284-L6288

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6284.** Liver. Hepatocyte. 4,990X. The micrograph has a central sinusoid surrounded by five cuboidal shaped hepatocytes. These hepatocytes are the same shape and have the same morphologic characteristics. Three have a central round nucleus. All of the cells have abundant mitochondria, RER, and an increase in SER. One hepatocyte has a large number of electron dense lysosomes. Peroxisomes not counted.
L6285. Liver. Hepatocyte. 7,530X. A slightly larger binucleated hepatocyte is found to the left of the center of the micrograph. The nuclei are round and of the same size, both have nucleoli; one nucleus has a large nucleolus. The cytosol is characterized by an increase in SER, less RER, and numerous small similar sized mitochondria. A few lipid droplets are also observed. Seven (7) peroxisomes are counted. Along the bottom edge of the cell, there is a small accumulation of lysosomes. Similarly, the hepatocyte below and adjacent to this cell also contains some lysosomes. In the upper right hand edge of the micrograph, there is a large sinusoid with one small erythrocyte.
L6286. Liver. Hepatocyte. 4,990X. A somewhat oblong hepatocyte is observed in the center of the micrograph surrounded by other hepatocytes of similar size and morphologic characteristics. The central cell has a distinctly round nucleus with a prominent nucleolus. Within the cytosol, there are a number of mitochondria, RER, some SER, and an increased number of small to medium sized lipid droplets. Peroxisomes difficult to discern; therefore, not counted.
L6287. Liver. Hepatocyte. 7,530X. A somewhat oval-shaped hepatocyte is observed in the center of the micrograph surrounded by similar hepatocytes. This cell has an oval to round nucleus with a central prominent nucleolus. The cytoplasm is packed with similar-sized mitochondria, some RER, and a few small lipid droplets. To the right side of the cell, there are a few small lysosome granules. Nine (9) peroxisomes are counted. Hepatocytes above and below this cell have an increase in SER as well as minimal lipid accumulation.
L6288. Liver. Hepatocyte. 7,920X. A cuboidal-shaped hepatocyte is found within the center of the micrograph. This cell has a slightly rounded nucleus with an irregular nuclear membrane. A marginating nucleolus is found within the nucleus. The cytoplasm is characterized by abundant mitochondria, some RER, a few small patches of SER and lipid droplets. Three of the lipid droplets have myelin figures. Ten (10) peroxisomes are counted.

Conclusions: Mild increase in SER. A few lysosomes observed as well. Peroxisome average is 8.7 per hepatocyte.

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-212 EM 01.38

Species/Strain: Crl:CD® (SD) IGS BR

Animal No.: C91335

Tissue: Liver - Periportal

Treatment Group: 4 (Mid-high 100ppm NEtFOSE)

Block No(s).: C91335 1A

Sex: Female

Photo/Negative No(s).: L6289-L6293

Significant Lesions (check one): X Yes _____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6289.** Liver. Hepatocyte. 10,200X. Approximately 90% of a hepatocyte is found filling the whole micrograph. The cell has a large round nucleus with finely granular chromatin. The cytoplasm is filled with an increase in SER, RER, and a number of small round mitochondria. There are a number of small to medium sized lipid droplets also scattered throughout the cell. Twelve (12) peroxisomes are observed. A knife mark is found running thru the cell (artifact).
L6290. Liver. Hepatocyte. 7,920X. A large cuboidal-shaped hepatocyte is found in the center of the micrograph. The cell has a large round nucleus with a large nucleolus. The cytoplasm is filled with numerous small mitochondria, RER, and SER. Lipid droplets are also observed. Fifteen (15) peroxisomes are counted. The bordering hepatocytes have similar characteristics especially an increase in SER.
L6291. Liver. Hepatocyte. 7,530X. A slightly larger oval hepatocyte is observed in the middle of the micrograph. The cell has a rounded nucleus and abundant cytoplasm. Mitochondria, RER, and an increase in SER are prominent features in the cytosol. There are a number of randomly scattered small and medium sized lipid droplets. Thirteen (13) peroxisomes are counted. Bordering hepatocytes have similar increase in SER and lipid.
L6292. Liver. Hepatocyte. 7,530X. A round hepatocyte is found in the center of the micrograph. The cell has a round nucleus and a cytoplasm filled with medium size lipid droplets. Additionally, mitochondria, and RER, a few patches of SER, and a small number of lysosomes are also observed. Nine (9) peroxisomes are counted. Bordering this cell in the lower left hand corner of the micrograph, there is another hepatocyte with also increased SER and some lysosomes. Above this cell, there is a wide sinusoid filled with serum plasma, erythrocytes, and a leukocyte.
L6293. Liver. Hepatocyte. 7,530X. A slightly larger oblong hepatocyte is found in the center of the micrograph. The cell has a large round nucleus. The cytosol is filled with numerous mitochondria, RER and SER. A small number of lipid droplets are also observed. Thirteen (13) peroxisomes are counted. A knife mark thru the middle of the cell is an artifact of sectioning.

Conclusions: SER is increased. Three hepatocytes are slightly larger than normal. Peroxisome average is 12.4 per hepatocyte.

TRANSMISSION ELECTRON MICROGRAPH INTERPRETATION

Study No.: 6329-212 EM 01.38

Species/Strain: Crl:CD® (SD) IGS BR

Animal No.: C91336

Tissue: Liver - Centrilobular

Treatment Group: 4 (Mid-high 100ppm NEtFOSE)

Block No(s).: C91336 1A

Sex: Female

Photo/Negative No(s).: L6294-L6298

Significant Lesions (check one): X Yes ____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6294.** Liver. Hepatocyte. 7,920X. A somewhat round hepatocyte is found in the center of the micrograph. This cell has a large round nucleus. The cytoplasm contains numerous mitochondria, RER, and SER. In the left half of the cell, there is a large accumulation of lipofuscin granules. Eleven (11) peroxisomes are counted. The surrounding hepatocytes have similar characteristics, especially an increase in SER. One hepatocyte, in the lower left hand corner of the micrograph that contains lipofuscin as well. There is a large sinusoid in the bottom right hand corner of the micrograph that contains erythrocytes.

L6295. Liver. Hepatocyte. 7,530X. A somewhat rounded hepatocyte is found in the middle of the micrograph surrounded on three sides by other hepatocytes with similar characteristics. The central hepatocyte has a distinctly rounded eccentrically located nucleus that has two nucleoli; one is somewhat central while the other is marginating along the periphery of the nucleus. The cytosol of this cell is characterized by an increase in SER, some RER, and numerous mitochondria. Four lipid droplets are also observed. A few small lysosomes are found randomly scattered throughout the cell. Nine (9) peroxisomes are counted. Two other hepatocytes in the micrograph also contain some lipofuscin granules. A sinusoid along the bottom right of the micrograph contain a large amount of cellular debris.

L6296. Liver. Hepatocyte. 7,530X. A staining, pyramidal-shaped hepatocyte is found in the center of the micrograph. The cell has an eccentrically located nucleus that contains a large somewhat round nucleolus. The cytoplasm of this cell is characterized by numerous mitochondria, RER, and SER. Along the left half of the cell, there is a large accumulation of lipofuscin. A few small to medium sized lipid droplets are also observed. Fourteen (14) peroxisomes are counted. Surrounding this hepatocytes are other hepatocytes with similar characteristics. A sinusoid in the upper left hand portion of the micrograph contains a clump of erythrocytes.

L6297. Liver. Hepatocyte. 7,530X. A slightly larger oblong hepatocyte (compared to other hepatocytes at same magnification), is found horizontally positioned in the center of the micrograph. This cell has a somewhat small irregular nucleus. The cytoplasm is distended with an increase in SER, RER, numerous mitochondria, and a few randomly scattered lipid droplets. Some of the lipid droplets have cellular debris or myelin figures. Twelve (12) peroxisomes are counted. Above this cell, there is another hepatocyte that appears slightly larger with an increase in SER also.

L6298. Liver. Hepatocyte. 7,920X. A triangular-shaped hepatocyte is found in the center of the micrograph. The cell has an extremely large nucleus. The cytoplasm is composed of numerous mitochondria, RER, and randomly scattered patches of SER. A few lipid droplets, some with myelin figures, are also observed. Six (6) peroxisomes are counted. Bordering this hepatocyte on the right is a larger hepatocyte. A perisinusoidal fat storing cell (Ito cell) is found in the upper right hand corner of the micrograph. In the lower left hand corner of the micrograph, there is a sinusoid lined by a prominent endothelial cell.

Conclusions: SER is increased. One hepatocyte is slightly hypertrophic Peroxisome average is 10.4 per hepatocyte.

Sex: Female

Photo/Negative No(s).: L6311-L6316

Significant Lesions (check one): X Yes ____ No

Interpreting Pathologist (signature and date): [signature] March 28, 2001

Features: **L6311.** Liver. Hepatocyte. 7,530X. An elongated oval obliquely positioned hepatocyte is observed in the middle of the micrograph. The cell has a large oval nucleus. The cytoplasm contains numerous small round mitochondria, RER, and patches of SER. Ten (10) peroxisomes are counted. Surrounding this cell are dilated sinusoids that contain erythrocytes and cellular debris. In addition, to the left of this cell, there is another hepatocyte with no nucleus but with similar cytoplasmic characteristics.
L6312. Liver. Hepatocyte. 7,920X. A pyramidal-shaped hepatocyte is observed in the center of the micrograph positioned obliquely. The cell has a large somewhat oval nucleus that has a large prominent nucleolus. Within the cytosol of this cell, there are three large lipid droplets. In addition to the lipid, there are a number of mitochondria, RER and SER. Five (5) peroxisomes are counted. The hepatocyte above this cell has even larger lipid droplets.
L6313. Liver. Hepatocyte. 7,530X. An elongated oblong-shaped hepatocyte is observed in the center between two other hepatocytes with no nuclei. The central hepatocyte has a nucleus that is somewhat oval. The cytoplasm of this cell contains an increase in the amount of SER along with mitochondria, RER, a few lipid droplets, and lysosomes. Seven (7) peroxisomes are counted. Adjacent to this cell on the left side of the micrograph, there is a perisinusoidal fat storing cell (Ito cell). The sinusoid along the right side of the micrograph contains a finely granular material (serum plasma).
L6314. Liver. Hepatocyte. 7,530X. An elongated binucleated cell is observed in the center of the micrograph positioned somewhat obliquely. The cell nuclei are similar in shape and size except one has two nucleoli. The cytoplasm of this cell contains scattered SER, RER, and mitochondria. Fifteen (15) peroxisomes are counted. Along the outer periphery of this cell, there are a number of large lipid vacuoles. Two large perisinusoidal fat storing cells (Ito cells) are found; one to the left of the cell, the other on the right bottom corner of the cell.
L6315. Liver. Hepatocyte. 7,530X. A cuboidal-shaped hepatocyte is found in the middle of the micrograph. The cell has a small eccentrically located nucleus. The cytoplasm contains abundant SER, less RER, and numerous mitochondria. Lipid droplets are also observed. Twelve (12) peroxisomes are counted. In the upper left half of the micrograph, a sinusoid is observed containing a number of erythrocytes. In the lower left hand corner, there is a sinusoid that contains a large leukocyte and two erythrocytes.
L6316. Liver. Hepatocyte. 4,990X. Three hepatocytes are observed in the micrograph. The hepatocyte in the middle is characterized by indistinct cell membranes. This cell has a large round nucleus and a cytoplasm with SER, RER, and mitochondria. Peroxisomes are not counted due to the inability to determine cell boundaries.

Conclusions: SER is increased. Peroxisome average is 9.8 per hepatocyte.

SECTION III

TRANSMISSION ELECTRON MICROGRAPHS

FIGURE LEGENDS

Figure 1. Liver. Hepatocyte. This micrograph illustrates a normal hepatocyte. Note the numerous mitochondria and RER. Animal no. C90724, control male. Print magnification (PM) =7,530X. Bar = 1 micron

Figure 2. Liver. Hepatocyte. . 7,920X. Another example of a normal hepatocyte. The cytoplasm of the cell is filled with RER, mitochondria, a few variable-sized lipid droplets, and randomly scattered small patches of SER. Animal no. C91144, control female. PM=7,920X. Bar = 1 micron.

Figure 3. Liver. Hepatocyte. This hepatocyte is illustrating a large increase in SER. A few small to medium sized lipid droplets are also observed. Clumps of erythrocytes are found within surrounding sinusoids. Animal no. C90908, mid-high dose treated male. PM=10,200X. Bar = 1 micron.

Figure 4. Liver. Hepatocyte. A large binucleated hepatocyte is found in the center of this micrograph. Note the large increase in SER and the numerous small to large lipid droplets. Bordering hepatocytes are also filled with numerous lipid droplets. Animal no. C90904, mid-high dosed treated male. PM=4,990X. Bar = 2 microns.

Figure 5. Liver. Hepatocyte. A cuboidal-shaped hepatocytes is located somewhat in the middle of the micrograph. Within the cytoplasm, there is an increase in SER, RER, and mitochondria. In the bottom half of the cell, there is an accumulation of lysosomes. Additionally, the hepatocyte in the left hand corner also contains small lysosomes. The contents of the lysosomes are presumably lipofuscin pigments. Animal no. C91324, mid-high dose treated female. PM = 4,990X. Bar = 2 microns.

Figure 6. Liver. Hepatocyte. A somewhat round hepatocyte is found in the center of the micrograph. The cytoplasm contains numerous mitochondria, RER, and an abundance of SER. In the left half of the cell, there is a large accumulation of lysosome presumed to contain lipofuscin pigment. Surrounding hepatocytes have similar characteristics, especially an increase in SER. A large sinusoid in the bottom right hand corner of the micrograph contains some erythrocytes. Animal no. C91336, mid-high dose treated female. PM = 7,920X. Bar = 1 micron.

COMPLIANCE STATEMENT

104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats

All aspects of this study were in accordance with the Food and Drug Administration Good Laboratory Practice Regulations as set forth in Title 21 of the Unites States Code of Federal Regulations, Part 58, issued December 22, 1978 (effective June 20, 1979), and with any applicable amendments.

ABSTRACT

The purpose of this study was to assess the carcinogenicity of the test material, N-Ethyl Perfluorooctanesulfonamido Ethanol (N-EtFOSE), when administered in the diet to rats for at least 104 weeks. This study was a supplementary study for Covance 6329-212.

Male and female Crl:CD®(SD)IGS BR rats were assigned to two groups (70 animals/sex/group). Group 8 received the control diet and Group 9 received diet containing 1 ppm N-EtFOSE.1.

Food was provided *ad libitum*, except when animals were fasted. Water was provided *ad libitum*. The animals were observed twice daily (a.m. and p.m.) for mortality and moribundity. At least once each week, each animal was removed from its cage and examined for abnormalities and signs of toxicity. Body weight data were collected weekly through Week 17, once every 4 weeks thereafter, and at Week 105. Food consumption data were collected weekly for the first 16 weeks and once every 4 weeks thereafter. Blood and urine samples were collected for hematology, coagulation, clinical chemistry, urinalysis, and urine chemistry tests at specified time points. Blood was also collected to provide serum for possible future analysis. During Weeks 4, 14, 53, and 105, selected animals were anesthetized, weighed, exsanguinated, and necropsied (Weeks 53 and 105). Additional liver samples were also collected for hepatocellular proliferation (Week 14) and biochemical analyses from five animals/sex/group (Weeks 4 and 14). Liver sections from five animals/sex/group from Group 9 were stained with Oil Red "O" and examined microscopically. At necropsy, macroscopic observations were recorded, selected organs were weighed (Week 53), and selected tissues were collected and preserved. Animals that died on test or were sacrificed at unscheduled intervals were also necropsied, but organ weights were not recorded. Microscopic examinations were done on tissues from each animal in Groups 8, and any animals that died on test or were sacrificed at unscheduled intervals. Lesions, liver, lungs, kidneys, pancreas, thyroid, testes, and mammary glands (females) from each animal in Group 9 were examined microscopically.

Test material consumption ranged from 0.029 to 0.108 mg/kg/day for Group 9.

Thirty-nine control males and 37 control females and 30 males and 35 females given 1 ppm died on test or were sacrificed in a moribund condition. There were no significant

differences in the mortality in both males and females. Kaplan-Meier estimates indicate there was no treatment-related detrimental effect on the survival of either sex.

Male and female Crl:CD®(SD)IGS BR rats were administered 0 or 1 ppm of (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol for at least 104 weeks. There were no test material-related effects on clinical observations, body weights, food consumption, clinical pathology results, organ weights, macroscopic or microscopic findings.

PURPOSE

The purpose of this study was to assess the carcinogenicity of the test material, N-Ethyl Perfluorooctanesulfonamido Ethanol (N-EtFOSE), when administered in the diet to rats for at least 104 weeks. This study was a supplementary study for Covance 6329-212.

REGULATORY COMPLIANCE

All aspects of this study were conducted in compliance with the Food and Drug Administration Good Laboratory Practice Regulations as set forth in Title 21 of the United States Code of Federal Regulations, Part 58, issued December 22, 1978 (effective June 20, 1979), and with any applicable amendments.

The protocol was reviewed and approved by the Institutional Animal Care and Use Committee at Covance.

TEST MATERIAL, VEHICLE, AND CARRIER

Test Material

The test material, T-6316 (narrow range N-ethyl perfluorooctanesulfonamido ethanol, N-EtFOSE), a blend of Lot Nos. 30035, 30037, and 30039, is a waxy solid and is 98.1% N-EtFOSE (w/w) (see Protocol Deviations for exceptions). It was received at Covance on June 20 and July 21, 1997.

To avoid repeated heating and sublimation, the two shipments of test material were heated, combined, and predetermined quantities of test material were aliquoted into polyethylene (LDPE) containers. The test material was stored at room temperature.

Information on synthesis methods, stability, composition, or other characteristics that define the test material was provided by the Sponsor and is on file with Covance.

Vehicle

The vehicle was acetone (Spectrum Chemical Mfg. Corp., New Brunswick, New Jersey and Gardena, California), Lot Nos. LW0044 (99.96% pure), LH0253 (99.8% pure), and NS0231 (99.8% pure). The shipments were received at Covance on April 9 and June 23, 1997, and September 8, 1998, respectively. The vehicle was stored at room temperature.

Information on synthesis methods, purity, composition, or other characteristics that define the acetone is on file with the manufacturer.

Carrier

Certified rodent diet (#5002 meal, LabDiet® by Purina Mills, Inc.) was used as supplied. The lot numbers are recorded in the data. The diet is routinely analyzed by the manufacturer for nutritional components and environmental contaminants.

Reserve (Archive) Samples

A reserve sample (5 g) of the test material was taken and stored at room temperature. This sample will be transferred to the Sponsor after completion of the inlife phase.

Disposition

Remaining test material was returned to the Sponsor on August 8, 2000.

TEST ANIMALS AND HUSBANDRY

Animals

Male and female Crl:CD®(SD)IGS BR rats were obtained from the Raleigh, North Carolina, facility of Charles River Laboratories on March 24, 1998. At initiation of treatment, the animals were 38 to 44 days old; the males weighed from 163 to 240 g, and the females weighed from 126 to 179 g.

Identification
Each animal was assigned a temporary number upon arrival. Before initiation of treatment, a microchip identification device was implanted into each animal. After randomization for placement on test, each animal was assigned a permanent number, and the microchip was coded with the permanent number. All data for an animal are recorded under these numbers.

Justification
Historically, rats have been used in safety evaluation studies and are recommended by appropriate regulatory agencies.

Husbandry
Animal Rooms 3045 and 335 were used for this study. Environmental controls for the animal room were set to maintain 18 to 26°C, a relative humidity of 30 to 70%, a 12-hour light/12-hour dark cycle, and a minimum of 10 room air changes/hour. Variations from these conditions are documented in the data and are considered to have had no effect on the outcome of the study.

The animals were housed individually (except for the first 6 days of acclimation when animals were group-housed) in stainless-steel cages. Some animals were placed in polycarbonate cages during the study when health problems dictated.

Certified rodent diet (#5002 meal, LabDiet® by Purina Mills, Inc.) was provided *ad libitum* during acclimation.

Water was provided *ad libitum*. Samples of the water are analyzed for specified microorganisms and environmental contaminants. The results are on file with Covance-Madison.

There were no known contaminants in the diet or water at levels that would have interfered with this study.

Animals not selected for the study (15 males and 15 females) were used for training procedures. Two extra males and one extra female were received and also used for training procedures.

Acclimation

One hundred fifty-seven males and 156 females were received on March 24, 1998, and acclimated in Animal Rooms 320 and 3045 for 13 days before initiation of treatment (animals were transferred to Animal Room 3045 on April 3, 1998). In general, animals in this shipment appeared healthy. During acclimation, the animals were examined for abnormalities indicative of health problems and body weights were recorded for all animals at randomization.

PROCEDURES

This study was conducted in accordance with the Protocol dated April 1, 1998, and Protocol Amendment Nos. 1 through 6. Protocol deviations are in Appendix 1.

Group Designations and Dose Levels

The animals used for this study were examined by a laboratory animal veterinarian on April 3, 1998, and found to be suitable for study consideration. Selection of animals for the study was based on acclimation data. Animals were assigned to treatment groups using a computerized blocking procedure designed to achieve body weight balance with respect to treatment group. At the time of randomization, the weight variation of the animals did not exceed ± 2 standard deviations of the mean body weight for each sex. Group mean body weights were analyzed using Levene's test for homogeneity of variance at the 5.0% probability level and found to be homogeneous. Animals were assigned to the study according to the following design.

Group[a]	No. of Animals		Dietary Levels (ppm N-EtFOSE)[b]
	Male	Female	
8 (Control)[c,d,e]	70	70	0
9 (Treated)[d,e]	70	70	1

a Groups were designated as Groups 8 and 9. This study was placed in the same animal room as Covance 6329-212.
b N-EtFOSE is 98.1% n-ethyl perfluorooctanesulfonamido ethanol (N-EtFOSE); dose levels are expressed as ppm of N-EtFOSE.
c The control animals received the control diet (basal diet with acetone).
d Five animals/sex/group were sacrificed during Weeks 4 and 14 for hepatocellular proliferation rate measurements and biochemical analyses (palmitoyl-CoA oxidation).
e Ten animals/sex/group were designated as interim sacrifice animals and were sacrificed after at least 52 weeks of treatment.

Dosing Procedures

Dose Preparation. Dietary concentrations were based on the test material as supplied. Diets were prepared at least once every 4 weeks.

Preparation of Diet for Group 8. The appropriate amount of certified diet was weighed and mixed with an appropriate volume of acetone.

Preparation of Stock and Base Diet. Diets were prepared in conjunction with Covance 6329-212. A stock preparation was made using the required amount of test material dissolved in the required volume of acetone. For the 300-ppm base diet, a premix consisting of a portion of the certified diet with the required amount of the stock preparation was mixed using a Hobart® mixer. The premix was transferred to a mixer with additional certified diet and mixed thoroughly.

Diet for Group 9. For the 1-ppm diet, a premix consisting of a portion of the certified diet, the required amount of the prepared base diet, and the required volume of acetone was mixed and then transferred to a mixer with additional certified diet and mixed thoroughly.

Samples for dose analyses were taken directly from the mixing bowl.

The diets were stored at room temperature in covered containers until dispensed into feeding jars.

Method of Administration. Dietary admixture was used because the potential route of exposure in humans is oral.

The dose preparations were administered *ad libitum*. Animals received the test diet for at least 104 weeks, as appropriate(see Protocol Deviations for exceptions).

Retention Samples. Samples (approximately 100 g) were taken from each dose preparation, during the inlife phase, and stored at room temperature. Unless used for analyses, retention samples from the treated groups were discarded at least 1 month after completion of the inlife phase. Samples from the control diets prepared for Weeks 1 through 14 were shipped to the Sponsor.

Dose Analysis

Analyses for the concentration of test material in the dose preparations were done by Covance using an analytical method, MP-M312-MA, validated by Covance.

Homogeneity was determined for the 1-ppm diet mixed for Week 1. One sample (approximately 100 g each) from the top, middle, and bottom of the diet was collected, divided into three subsamples for extraction and analysis, and analyzed for test material content. All samples were stored at room temperature until analyzed.

To establish stability, two additional samples (approximately 100 g each) were taken from the 1-ppm diet mixed for Week 1. The middle homogeneity sample was analyzed on the day of mixing and served as the stability time zero sample. One sample was stored at room temperature for 21 days, then analyzed. The other sample was stored at room temperature for 32 days, then analyzed. Stability analyses were also conducted on another mix (June 5, 1998). The routine sample from that mix served as the time zero sample. Samples were stored at room temperature for 32 days or 46 days at room temperature, then analyzed.

Samples (approximately 100 g each) were collected from all dose preparations and analyzed in duplicate. The homogeneity sample collected from the middle of the dose

preparation for Week 1 was used for dose confirmation results. All samples were stored at room temperature until analyzed.

Observation of Animals

Clinical Observations. The animals were observed twice daily (a.m. and p.m.) for mortality and moribundity (see Protocol Deviations for exceptions). Once prior to treatment and weekly thereafter, each animal was removed from its cage and examined; abnormal findings or an indication of normal were recorded. In addition, the time of onset, location, size, appearance, and progression of each grossly visible or palpable mass were recorded.

Body Weights. Individual body weight data were recorded on Day -3 (randomization), weekly for Weeks 1 through 17 (see Protocol Deviations for exceptions), once every 4 weeks thereafter, and at Week 105.

Food Consumption. Individual food consumption data were recorded weekly for Weeks 1 through 16 (see Protocol Deviations for exceptions) and once every 4 weeks thereafter (see Protocol Deviations for exceptions).

Clinical Pathology

Blood and urine samples were collected from 10 animals/sex/group during Weeks 14, 27, and 53. Blood films were made and held for possible future examination from animals sacrificed at unscheduled intervals and from animals at scheduled sacrifice after at least 104 weeks of treatment.

Animals were fasted overnight, and urine was collected chilled for approximately 16 hours before blood sampling; water was provided *ad libitum*. Blood was collected from a jugular vein. The anticoagulant was potassium EDTA for the hematology tests. Samples for clinical chemistry and serum samples were collected without an anticoagulant. Animals were bled in random order. The following were evaluated.

Hematology

- red blood cell (erythrocyte) count
- hemoglobin
- hematocrit
- mean corpuscular volume
- mean corpuscular hemoglobin
- mean corpuscular hemoglobin concentration
- platelet count
- white blood cell (leukocyte) count
- differential blood cell count
  - segmented neutrophil count
  - lymphocyte count
  - monocyte count
  - eosinophil count
  - basophil count
- blood cell morphology

Reticulocyte smears were made and held for possible future examination.

Clinical Chemistry

- glucose
- urea nitrogen
- creatinine
- total protein
- albumin
- globulin
- cholesterol
- total bilirubin
- alanine aminotransferase
- gamma glutamyltransferase
- aspartate aminotransferase
- calcium
- inorganic phosphorus
- sodium
- potassium
- chloride

Urinalysis

- appearance
- volume
- specific gravity
- pH
- protein
- urobilogen
- glucose
- ketones
- bilirubin
- blood
- microscopic examination of sediment

Urine Chemistry

- sodium
- potassium
- 16-hour excretion of:
  - sodium
  - potassium

Serum Analyses

Blood (approximately 2 mL at the Weeks 4 and 14 sacrifices and approximately 3 mL at the Week 53 and 105 sacrifices) was collected. Samples were collected from five animals/sex/group during Weeks 4 and 14 (animals selected for hepatocellular

proliferation and biochemical analyses); five animals/sex/group (from animals selected for interim sacrifice) after at least 52 weeks of treatment; and 10 animals/sex/group at terminal sacrifice.

Animals were fasted overnight and blood was collected without an anticoagulant from a jugular vein. Blood samples were allowed to clot at room temperature, then centrifuged. Serum samples were harvested and stored in a freezer set to maintain -60 to -80°C. Samples were shipped on dry ice to the Sponsor for possible future analyses.

Anatomic Pathology

Necropsy. A necropsy was done on each animal that died or was sacrificed at an unscheduled interval. Animals were sacrificed with carbon dioxide, weighed, and exsanguinated.

During Week 4, five animals/sex/group were fasted overnight, bled for serum samples, anesthetized with carbon dioxide, weighed, and exsanguinated. The liver was removed and weighed. Additional liver samples were stored in a freezer, set to maintain -60 to -80°C, and sent to the Sponsor for possible future analysis.

During Week 14, five animals/sex/group were fasted overnight, bled for serum samples, anesthetized with carbon dioxide, weighed, and exsanguinated. The liver was removed and weighed. Additional liver samples were stored in a freezer, set to maintain -60 to -80°C, and shipped to the Sponsor for possible future analysis.

After at least 52 weeks of treatment, 10 animals/sex/group were fasted overnight, bled for clinical pathology (all animals) and serum samples (five animals/sex/group), anesthetized with carbon dioxide, weighed, exsanguinated, and necropsied. Additional liver samples (five animals/sex/group) were stored in a freezer, set to maintain -60 to -80°C, and shipped to the Sponsor for possible future analysis.

After 104 weeks of treatment, the remaining animals were fasted overnight, bled for serum samples (10 animals/sex/group), anesthetized with carbon dioxide, weighed, exsanguinated, and necropsied. Liver samples from 10 animals/sex/group were stored in a freezer, set to maintain -60 to -80°C, and shipped to the Sponsor for possible future analysis.

The necropsy included a macroscopic examination of the external features of the carcass; external body orifices; the abdominal, thoracic, and cranial cavities; organs; and tissues.

Proliferation Cell Nuclear Antigen Evaluation

At the Week 14 collection, representative samples of left lateral lobe of the liver and macroscopic lesions of the liver were collected and preserved in zinc formalin. After fixation, each sample of the liver was embedded in paraffin, and the paraffin blocks were shipped to Pathology Associates International. Proliferation cell nuclear antigen (PCNA) evaluation were done on the samples. In addition, sections of the left lateral lobe of the liver were stained with hematoxylin and eosin and examined microscopically.

Palmitoyl-CoA Oxidase Tissue Collection and Analyses

At the Week 4 and 14 sacrifices, sample (approximately 500 mg) of the right lateral lobe of the liver was also collected from each animal and flash-frozen in liquid nitrogen (see Protocol Deviations for exceptions). The liver tissue was stored in a freezer, set to maintain -60 to -80°C, until analyzed for palmitoyl-CoA oxidase activity.

Organ Weights. At the interim sacrifice during Week 53, the following organs were weighed (see Protocol Deviations for exceptions); paired organs were weighed separately.

adrenal (2)	ovary (2)
brain	spleen
kidney (2)	testis (2)
liver	thyroid (2) with parathyroid
lung	uterus with cervix

Organ-to-body weight percentages and organ-to-brain weight ratios were calculated.

Tissue Preservation. The following tissues were collected and preserved in 10% neutral-buffered formalin (see Protocol Deviations for exceptions).

adrenal (2)
brain
cecum
cervix
colon
duodenum
epididymis (2)
esophagus
eye (2)
femur with bone marrow (articular surface of the distal end)
Harderian gland
heart
ileum
jejunum
kidney (2)
lesions
liver
lung with mainstem bronchi
lymph node (mesenteric)
mammary gland (females only)
ovary (2)
pancreas
pituitary
prostate
rectum
salivary gland [mandibular (2)]
sciatic nerve
seminal vesicle (2)
skeletal muscle (thigh)
skin
spinal cord (cervical, thoracic, and lumbar)
spleen
sternum with bone marrow
stomach
testis (2)
thymus
thyroid (2) with parathyroid
trachea
urinary bladder
uterus
vagina

Bone marrow smears from the femur of each animal at the Week 53 and terminal sacrifices were prepared, stained with Wright's stain, and retained for possible examination.

Histopathology. Tissues (as appropriate) were embedded in paraffin, sectioned, stained with hematoxylin and eosin, and examined microscopically (see Protocol Deviations for exceptions) from each animal in Group 8 sacrificed at the terminal sacrifice and any animals that died on test or were sacrificed at unscheduled intervals.

Lesions, liver, lungs, kidneys, pancreas, thyroid, testes, and mammary glands (females) from each animal in Group 9 were embedded in parafilm, sectioned, stained with hematoxylin and eosin, and examined microscopically. Parathyroids were processed with the thyroids but were not examined.

A pathology peer review was conducted by a pathologist designated by the sponsor. Results are reported in Covance 6329-212.

Liver sections from five animals/sex/group from Group 9 were stained with Oil Red "O" and examined microscopically.

Statistical Evaluation

Levene's test (Levene, 1960) was done to test for variance homogeneity. In the case of heterogeneity of variance at $p \leq 0.05$, transformations were used to stabilize the variance. Comparison tests took variance heterogeneity into consideration.

One-way analysis of variance [ANOVA (Winer, 1971)] was used to analyze initial body weights, body weight changes, food consumption, continuous clinical pathology values, and organ weight data.

ANOVA was done on the homogeneous or transformed data. If the ANOVA was significant, student's t-test was used for pairwise comparisons between treated and control groups.

Group comparisons (Group 9 versus Group 8) were evaluated at the 5.0%, two-tailed probability level. Only data collected on or after the first day of treatment were analyzed statistically.

Survival and Tumor Analysis

Survival was analyzed using life table techniques consisting of Kaplan-Meier product limit estimates, Cox-Tarone binary regression, and Gehan-Breslow nonparametric methods (Thomas, Breslow, and Gart, 1977). Cox-Tarone methods are weighted heavier towards late incidences and Gehan-Breslow methods are weighted towards early incidences due to treatment. As a result, they are both valuable tools for the incidence data with onset times. Week 105 was treated as the end of the study (EOS) in the NCI package for both sexes. The Weeks 4, 14 and 53 interim sacrifices animals and Week 105 terminal sacrifice animals were censored in the analysis. Continuity corrected two-sided tail probability was evaluated at the 5% significance level for comparing the Control vs. Treated group.

Nonneoplastic Lesions. Nonneoplastic lesions were chosen for statistical analyses if the incidence rate in the treated group was increased or decreased by at least two occurrences

over the control group. These were analyzed by one-sided Fisher-Irwin exact test at 5% significance level (Thakur, Berry, and Mielke, 1985).

Neoplastic Lesions. Neoplastic lesions were chosen for statistical analyses if the incidence rate in the treated group was increased or decreased by at least two occurrences over the control. The incidental tumors (i.e., tumors that were not assigned to be the cause of death of the animals by the study pathologist) were analyzed by logistic regression of tumor prevalence (Dinse and Lagakos, 1983). In this approach, tumor prevalence was modeled as a logistic function of dose and time. Both linear and quadratic terms in time were incorporated initially, and the quadratic term was eliminated if there was lack of convergence. Further, in the cases where there was lack of convergence for the asymptotic test of the logistic regression method, the exact probability of the test was obtained by using LogXact-Turbo (1993). The fatal and palpable (superficial) tumors were analyzed by Cox-Tarone binary regression method as in the case of survival, using the death time or the first palpation time (if applicable) as the tumor onset time.

The benign and malignant neoplastic incidences were evaluated separately, as well as combined, where appropriate. The criteria for combination were based on the work of McConnell et al. (1986). The incidences of multiple-organ findings such as fibroma, fibrosarcoma, leiomyoma, leiomyosarcoma, lymphoma, and endometrial stromal polyp were counted by animal, not by tissue type. They were evaluated statistically if they met the selection criterion for the analysis. The statistical results for these cases may be biased because not all the animals were examined for every tissue. One-sided tail probabilities for group comparison was evaluated at the 5% significance level.

In the nonneoplastic and neoplastic lesions, early sacrificed animals during or before Week 14 in both groups were excluded from the denominators. Ordinal dose levels 0, and 1 corresponding to Groups 8 (Control), and 9 (Treated) were used in the above statistical analysis. Continuity correction was done for all the asymptotic tests. The following notations are used throughout this report.

\+ = Effect in the increased direction
\- = Effect in the decreased direction
E = Exact permutation test

Record Retention

The raw data, documentation, records, specimens, protocol, and final report generated as a result of this study will be archived in the storage facilities of Covance-Madison. At least 1 year after submission of the final report, the Covance Archives staff will contact the Sponsor. At that time, the Sponsor may choose to have the aforementioned materials returned, archived for an additional period of time, or disposed of by Covance; a fee will be charged based on the archive disposition option selected by the Sponsor. Raw data stored on magnetic media and the protocol, study correspondence, and the original final report will be retained by Covance. At least 1 year after submission of the final report, any frozen samples will be returned to the Sponsor, retained by Covance, or disposed of, and a fee will be charged. Data generated by the Sponsor will be archived in the Sponsor's storage facilities. PCNA evaluation data, paraffin blocks, and tissue slides for PCNA will be retained by Pathology Associates International. Frozen liver samples and serum samples sent to the Sponsor will be retained by the Sponsor.

RESULTS AND DISCUSSION

Dose Analysis

Results of the homogeneity, stability, and dose preparation analyses are in Tables 1 through 3.

Mean values of the homogeneity analyses for the mix done on March 30, 1998, ranged from 91.3 to 106% of the theoretical concentration for the diet containing 1 ppm N-EtFOSE. These results indicate that the mixing procedure produced a homogeneous distribution of the test material in the dose preparation.

Results of the stability analyses for the mix conducted on June 5, 1998, of samples stored 32 days at room temperature conditions indicated that a mean concentration was 81.8% of the theoretical concentration of 1 ppm. Results of stability analyses for the mix conducted on June 5, 1998, of samples stored at room temperature for 46 days indicated that the mean concentration was 98.1% of the theoretical concentration of 1 ppm.

The mean concentrations of the dose preparation analyses for the 1-ppm level ranged from 74.3 to 120% of the theoretical concentration (including reassay and retention sample analyses, but excluding data that required reanalysis). Inherent variability and

lack of sufficient sensitivity at low levels in the analytical method for measuring N-EtFOSE resulted in analyses data that were in many cases outside the standardly acceptable limits of ±15%.

Observation of Animals

Survival and Clinical Observations. Clinical observations including mass observations are summarized in Tables 5 and 6; individual data are in Appendix 2. Survival data are illustrated in Figures 1 and 2 and summarized in Table 4. Statistical analyses of survival data are presented in the report of survival analysis. Individual animal fate data are in Appendix 2.

Thirty-nine control males and 37 control females and 30 males and 35 females given 1 ppm died on test or were sacrificed in a moribund condition. The most frequent cause of death was pituitary adenomas. There were no significant differences in the mortality in both males and females. Kaplan-Meier estimates indicate there was no treatment-related detrimental effect on the survival of either sex.

Clinical observations were similar in nature and in the total number of affected animals in all groups.

Body Weights. Body weight and body weight change data are illustrated in Figures 3 and 4 and summarized in Tables 7 and 8; individual body weight data are in Appendix 3.

There were no test material-related effects on body weights or body weight changes during the study.

Food Consumption. Food consumption data are illustrated in Figures 5 and 6 and summarized in Table 9; individual data are in Appendix 4.

There were no test material-related effects on food consumption during the study.

Test Material Consumption. Test material consumption data are summarized in Table 10. Individual test material consumption data are presented in Appendix 4.

Test material consumption ranged from 0.029 to 0.108 mg/kg/day for Group 9.

Clinical Pathology

Hematology, coagulation, clinical chemistry, urinalysis, and urine chemistry data are summarized in Tables 11 through 23 individual data are in Appendix 5. The Pathology Report contains a discussion of the data.

Dietary administration of N-EtFOSE at 1 ppm for approximately 52 weeks had no effects on clinical pathology test results.

Anatomic Pathology

Organ weight data are summarized in Tables 24 through 26; incidences of macroscopic and microscopic observations are summarized in Tables 27 through 36; the incidence of severity of selected microscopic observations is summarized in Tables 37 through 40. Individual data are in Appendix 6. The Pathology Report contains a discussion of the data.

There were no test material-related changes for terminal body weights, absolute organ weights, organ-to-body weight percentages or organ-to-brain weight ratios for any of the sacrifices.

The incidence of mortality was similar for treated and control animals, and there were no test material-related macroscopic or microscopic findings at any of the study intervals.

Proliferation Cell Nuclear Antigen Results

The cell proliferation report is in Appendix 7.

After 14 weeks on study, enhanced cell proliferation was not evident in the liver of male and female rats exposed to 1 ppm N-EtFOSE.

CONCLUSION

Male and female Crl:CD®(SD)IGS BR rats were administered 0 or 1 ppm of (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol for at least 104 weeks. There were no test material-related effects on mortality, clinical observations, body weights, food consumption, clinical pathology results, organ weights, macroscopic or microscopic findings.

PATHOLOGY REPORT

SUMMARY

The purpose of this study was to assess the carcinogenicity of the test material, N-Ethyl Perfluorooctanesulfonamido Ethanol (N-EtFOSE) when administered in the diet to rats for at least 104 weeks. The test material was administered at a dose level of 1 ppm.

Dietary administration of N-EtFOSE at 1 ppm for approximately 52 weeks had no effects on clinical pathology test results.

There were no test material-related changes for terminal body weights, absolute organ weights, organ-to-body weight percentages or organ-to-brain weight ratios for any of the sacrifices.

The incidence of mortality was similar for treated and control animals, and there were no test material-related macroscopic or microscopic findings at any of the study intervals.

METHODS

Two groups of male and female Crl:CD®(SD)IGS BR rats (70 animals/sex/group) were fed diets containing the test material at a dose level of 0 (control group; received basal diet only) or 1 ppm. These groups were designated as Groups 8 and 9, respectively, and the animals were located in the same animal room as Covance Study No. 6329-212.

During Weeks 14, 27, and 53, blood and urine were collected for hematology, clinical chemistry, urinalysis, and urine chemistry tests from 10 animals/sex/group. Blood films were made for all animals sacrificed at unscheduled intervals and at the terminal sacrifice during Week 105.

Necropsies were performed on all animals that died or were sacrificed due to poor health, 10 animals/sex/group sacrificed during Week 53, and all remaining surviving animals during Week 105. At necropsy, macroscopic observations were recorded, organ weights were obtained (for sacrifices during Week 53), and tissues were placed in fixative as

specified by the protocol. All tissues from animals in Group 8 and selected tissues from animals in Group 9 were examined microscopically.

Five animals/sex/group were sacrificed during Week 4 for hepatic palmitoyl-CoA oxidase activity and during Week 14 for hepatocellular proliferation rate measurements and hepatic palmitoyl-CoA oxidase activity.

Statistically significant differences cited in the Results and Discussion section are based on comparisons between the control and treated groups.

RESULTS AND DISCUSSION

Mortality

The incidence of mortality during the study was similar for treated and control animals. Thirty-nine control males and 37 control females, and 30 males and 35 females given 1 ppm died on test or were sacrificed in moribund condition.

Clinical Pathology

Weeks 4 and 14 (hepatic palmitoyl-CoA oxidase activity). Administration of the test material had no effect on hepatic palmitoyl-CoA oxidase activity.

Weeks 14, 27, and 53. There were several small, but statistically significant, differences for clinical pathology results between the control and treated animals. None of these small differences were consistent over time or between sexes, and all were considered to be incidental and unrelated to administration of the test material.

Anatomic Pathology/All Animals

Macroscopic Findings. The most frequently observed findings at necropsy were, thin animals, ocular discharge, ventral compression of the brain, pituitary masses, and dark foci in the stomach. Other frequent incidental macroscopic findings for males were perineal/perianal staining, rough surface of the kidneys, and dark foci in the stomach. Frequently observed findings for females were mammary masses, ovarian cyst, ocular discharge, and nasal discharge.

Microscopic Findings/Neoplastic Findings. The most frequently observed neoplasm was pituitary adenoma. Islet cell adenomas of the pancreas were frequently present for males, and c-cell adenomas of the thyroid and mammary adenomas, fibroadenomas and carcinomas were frequently present for females. Other tumors were only present in a few animals.

Microscopic Findings/Nonneoplastic Findings. The most frequently observed nonneoplastic findings were proteinaceous casts in the kidneys, chronic progressive nephropathy, hepatocellular vacuolation, ventral compression and ventricular dilatation of the brain, degeneration/necrosis of the heart, and pituitary hemorrhage. Frequent microscopic nonneoplastic findings for males were chronic inflammation of the liver, acinar atrophy of the pancreas, fibrosis of the heart, vacuolation of the adrenal cortex, chronic active inflammation of the prostate, and acute inflammation of the footpad. Other frequently observed nonneoplastic microscopic findings for females were pelvic mineralization of the kidneys, ultimobranchial cysts of the thyroid, galactocele, cysts of the thymus, and angiectasis, cystic degeneration, and hemorrhage and thrombi of the adrenal cortex.

Anatomic Pathology/Unscheduled Deaths

There was no test material-related effect for mortality. The only causes of death observed in three or more animals were hepatocellular adenoma, histiocytic sarcoma, and pituitary adenoma for males, and mammary carcinoma, mammary fibroadenoma, and pituitary adenoma for females. By far the most frequent cause of death was pituitary adenomas. The cause of death was undetermined for 11 males and 2 females.

Macroscopic Findings. There were no test material-related macroscopic findings.

Microscopic Findings. There were no test material-related microscopic findings for the unscheduled death animals.

Anatomic Pathology/Week 4 Sacrifice

Organ Weights. There were no test material-related changes for terminal body weights or absolute or relative liver weights.

Macroscopic Findings. There were no macroscopic findings present at necropsy.

Anatomic Pathology/Week 14 Sacrifice

Organ Weights. There were no test material-related changes for terminal body weights or absolute or relative liver weights.

Macroscopic Findings. There were no macroscopic findings present at necropsy.

Anatomic Pathology/Week 53 Sacrifice

Organ Weights. There were no test material-related changes for terminal body weights or absolute or relative liver weights.

Macroscopic Findings. There were no test material-related macroscopic findings.

Microscopic Findings. There were no test material-related microscopic findings. The microscopic findings observed at the 53-week sacrifice were typical of those observed as spontaneous findings in rats.

Anatomic Pathology/Terminal Sacrifice

Macroscopic Findings. There were no test material-related macroscopic findings.

Microscopic Findings. There were no test material-related microscopic findings for the terminal sacrifice animals.

STATISTICAL REPORT OF SURVIVAL, NONNEOPLASTIC, AND NEOPLASTIC LESIONS

Methods

Survival was analyzed using life table techniques consisting of Kaplan-Meier product limit estimates, Cox-Tarone binary regression, and Gehan-Breslow nonparametric methods (Thomas, Breslow, and Gart, 1977). Cox-Tarone methods are weighted heavier towards late incidences and Gehan-Breslow methods are weighted towards early incidences due to treatment. As a result, they are both valuable tools for the incidence data with onset times. Week 105 was treated as the end of the study (EOS) in the National Cancer Institute package for both sexes. The Weeks 4, 14, and 53 interim sacrifices animals and Week 105 terminal sacrifice animals were censored in the analysis. Continuity corrected two-sided tail probability was evaluated at the 5.0% significance level for comparing the Control vs. Treated groups, as reported in Text Tables 1 and 2. Kaplan-Meier product limit survival curves are presented in Figures 1 and 2 for the males and females, respectively.

Nonneoplastic Lesions. Nonneoplastic lesions were chosen for statistical analyses if the incidence rate in the treated group was increased or decreased by at least two occurrences over the control group. These were analyzed by one-sided Fisher-Irwin exact test at 5.0% significance level (Thakur, Berry, and Mielke, 1985), and the results are reported in Text Tables 3 and 4 for the males and females, respectively.

Neoplastic Lesions. Neoplastic lesions were chosen for statistical analyses if the incidence rate in the treated group was increased or decreased by at least two occurrences over the control. The incidental tumors (i.e., tumors that were not assigned to be the cause of death of the animals by the study pathologist) were analyzed by logistic regression of tumor prevalence (Dinse and Lagakos, 1983). In this approach, tumor prevalence was modeled as a logistic function of dose and time. Both linear and quadratic terms in time were incorporated initially, and the quadratic term was eliminated if there was lack of convergence. Further, in the cases where there was lack of convergence for the asymptotic test of the logistic regression method, the exact probability of the test was obtained by using LogXact-Turbo (1993). The fatal and palpable (superficial) tumors were analyzed by Cox-Tarone binary regression method, as in the case of survival, using the death time or the first palpation time (if applicable) as the tumor onset time.

The benign and malignant neoplastic incidences were evaluated separately as well as combined where appropriate. The criteria for combination were based on the work of McConnell et al. (1986). The incidences of multiple-organ findings such as fibroma, fibrosarcoma, leiomyoma, leiomyosarcoma, lymphoma, and endometrial stromal polyp were counted by animal, not by tissue type. They were evaluated statistically if they met the selection criterion for the analysis. The statistical results for these cases may be biased because not all the animals were examined for every tissue. One-sided tail probabilities for group comparison were evaluated at the 5.0% significance level and are shown in Text Tables 5 and 6 for the males and females, respectively.

In the nonneoplastic analyses, animals sacrificed early (Week 4) were excluded. In the statistical evaluation of the neoplastic lesions, animals sacrificed early (during or before Week 14) were discounted from the number of animals at risk. Ordinal dose levels 0 and 1 corresponding to Groups 8 (Control) and 9 (Treated) were used in the above statistical analysis. Continuity correction was done for all the asymptotic tests. The following notations are used throughout this report.

+ = Effect in the increased direction
- = Effect in the decreased direction
E = Exact permutation test

Results and Discussion

Survival. As indicated by the Kaplan-Meier adjusted survival curves (Figures 1 and 2) and by Text Tables 1 and 2, there was no significant difference in mortality in either the males or females.

Nonneoplastic Lesions. The liver in both sexes has been identified as the only organ that is appropriate for performing statistical analyses for nonneoplastic lesions.

As shown in Text Tables 3 and 4, no significant differences were noted in any of the hepatocellular nonneoplastic lesions in either sex.

Neoplastic Lesions. As indicated in Text Tables 5 and 6, there were no significant incidences of any neoplastic findings in either sex.

COMMENTS ON THE DATA

Various models of calculators, computers, and computer programs were used to analyze data in this study. Because different models round off or truncate numbers differently, values in some tables (e.g., means, standard deviations, or individual values) may differ slightly from those in other tables, from individually calculated data, or from statistical analysis data. Neither the integrity nor the interpretation of the data was affected by these differences.

The units for the dose levels in the inlife summary tables are ppm.

The number of animals listed in the heading of the summary tables for clinical and mass observations reflects the number of animals assigned to each group at the start of the study.

The summary tables for clinical observations indicates the number of animals for which a condition was observed without regard to the reversibility, number of incidences/animal, or the length of time the condition persisted.

Only observations for each animal other than normal are indicated in the summary clinical observations tables.

Each animal with observations recorded as "Normal" throughout the study has the comment "No remarkable observations" indicated in the individual clinical observations tables.

The specific details for comments in the individual clinical observations tables that are indicated with a "C" can be found at the end of each group for each sex.

Food consumption values are reported in whole numbers; however, the data collection system carries food consumption values to one place to the right of the decimal for test material consumption calculations. The differences in values generated do not influence the interpretation of the calculation.

The comment "SPILLED" in individual food consumption data tables indicates that food consumption was not recorded due to spillage during the interval.

The comment "NOT TAKEN" in individual food consumption data tables indicates that the animal died before the end of the food consumption interval.

Differences in the population size (N) in the summary tables for clinical and anatomic pathology are explained in the individual data tables or the codes sheets or in the Protocol Deviations section.

COMMENTS ON THE DATA (Continued)

Results of clinical pathology samples collected for animals sacrificed at unscheduled intervals appear in the individual clinical pathology tables for the next scheduled interval. These results are not in the summary tables and are not included in the statistical analyses.

Statistical analyses were not done when there were two or fewer values for a parameter.

The calculation for individual test material consumption is:

Test material consumption =

$$\frac{\text{Diet Concentration} \times \text{Food Consumption}}{\text{Food Consumption Interval} \times [\text{First Body Weight of Interval} + (\text{Daily Body Weight Gain} \times \text{Day Factor})]}$$

where: Daily Body Weight Gain =

$$\frac{\text{Last Body Weight of Interval} - \text{First Body Weight of Interval}}{\text{Day of Last Body Weight of Interval} - \text{Day of First Body Weight of Interval}}$$

and: Day Factor =

$$(\text{Food Consumption Start Day} - \text{Day of First Body Weight of Interval}) + \frac{\text{Food Consumption Interval}}{2}$$

and: Food Consumption Interval =

$$\text{Food Consumption End Day} - \text{Food Consumption Start Day}$$

CODES, ABBREVIATIONS, AND UNITS

General Codes and Abbreviations
Codes for Clinical Pathology
Abbreviations and Units for Clinical Hematology
Abbreviations and Units for Clinical Chemistry
Abbreviations and Units for Clinical Urinalysis
Abbreviations and Units for Urine Chemistry
Codes for Anatomic Pathology

Note: The following lists of codes, abbreviations, and units are used by Covance. Some, but not necessarily all, of this information may be needed for this report.

General Codes and Abbreviations

WK	Week
N	Number of measurements in a group
Mean; MEAN	Arithmetic mean
CAM	Covariate-adjusted mean
SD; S.D.; STAND DEV; STANDARD DEV; sd	Standard deviation
*	Group mean is significantly different from the mean of the control group (Group 1) at $p \leq 0.05$
-; NA	No value; not applicable; not present
P	Present
C	Comment found at the end of each group for each sex
UNSCHED	Unscheduled
DISPATCH	Observations transferred from the inlife module of the data collection system to the necropsy module for reference during necropsy. Observations are duplicates of the last inlife observations.

Animal Death Codes

1	Interim sacrifice, Week 4
2	Interim sacrifice, Week 14
3	Interim sacrifice, Week 52
T	Terminal sacrifice
D	Found dead
M	Moribund

Codes for Clinical Pathology

GENERAL CODES

NS	No sample
QS/QNS	Quantity not sufficient
NR	No repeat (sample volume not sufficient for repeat analysis)
FS	Fibrin strands
SC	Sample clotted
SH	Slightly hemolyzed
H	Hemolyzed
SL	Slightly lipemic
L	Lipemic
SI	Slightly icteric
I	Icteric
NF	Animal not fasted
U	Unscheduled/moribund bleed
DT/DOT	Animal died on test
DB	Died during bleeding
TJ	Technician judgment to repeat test
TE	Technical error (instrument or technician error that results in unacceptable data, e.g., unacceptable instrument output, sample spilled, entry of invalid data)
RE	Recording error (recorded incorrect data, e.g., wrong number, spelling error, incorrect date)
EE	Entry error (incorrect keyboard entry)
SE	Sampling error
PC	Platelets clumped
PD	Platelets decreased
PI	Platelets increased
PL	Platelets large
PA	Platelets appear adequate
CO	Color interferes with test
HB	Heinz bodies observed
PLASMO	Plasmodium
NO AGG	No aggregation
FR	Fractious
UTD	Unable to determine
NO COAG	No coagulation

Codes for Clinical Pathology (Continued)

RESULTS NOT INCLUDED IN STATISTICAL ANALYSES

Hemolyzed clinical chemistry or coagulation samples
Samples from animals at unscheduled intervals
Prothrombin times (PT) greater than 50 seconds
Activated partial thromboplastin times (PTT) greater than 110 seconds
Bleed times (BLETIME) greater than 30 minutes

CODES FOR BLOOD CELL MORPHOLOGY

The following scale was used to measure the degree of anisocytosis (ANISO), poikilocytosis (POIK), polychromasia (POLY), hypochromasia (HYPO), or basophilic stippling (BASTIP) or the presence of Howell-Jolly bodies (HJBODY), toxic neutrophils (TOXNEUT), or atypical lymphocytes (ATYPLYM).

Scale	Degree	Presence
-	Normal for the species	Not present
1	Slight	Rare
2	Moderate	Few
3	Marked	Moderate
4	Not applicable	Many

Codes for Anatomic Pathology

Code	Definition

MACROSCOPIC CODES

EX	Indicates that organ weight is excluded from calculations
NOT TAKEN	Organ weight not taken; explanation given in necropsy notes
MISSING	Organ missing or lost
UNSUITABLE	Organ technically unsuitable for weighing
AUTOLYTIC	Organ autolyzed and could not be weighed
EXCLUDE	Weight was taken, but was excluded from all calculations

MICROSCOPIC CODES

Codes Prefacing Neoplastic Findings

B-	Primary, benign neoplasm
M-	Primary, malignant neoplasm
N-	Metastatic neoplasm
I-	Locally invasive neoplasm
X-	Other neoplasm

Distribution of Findings

Focal
Diffuse
Multifocal

Grades for Severity or Amount

1	Minimal - the least amount of change that can be observed with the light microscope
2	Slight - less than average amount of change, but readily discernible as abnormal
3	Moderate - the average amount of change that is expected for a lesion
4	Moderately severe (marked) - a marked amount of change with possible loss of function of the affected cells or organs
5	Severe - a great amount of change with probable loss of function of the affected cell or organs and frequently involves large areas of the organ

Codes for Anatomic Pathology (Continued)

Other Microscopic Codes

TL	Total
P	Finding present
-	Finding not present
MN	Mean

TISSUE ABBREVIATIONS

Abbreviation	Definition
LN	Lymph node
GL	Gland
STOMACH, GL	Glandular stomach
STOMACH, NONGL	Nonglandular stomach
SALIV GL, MANDIB	Mandibular salivary gland
LN, ANT MES/PANC	Anterior mesenteric/pancreatic lymph node
AUDITORY SEB GL	Auditory sebaceous gland
LACRIMAL GLAND, EX	Exorbital lacrimal gland
HEMATO NEOPLASIA	Hematopoietic neoplasia
LACRIMAL GL, INT	Internal lacrimal gland
CAVITY, ABDOM	Abdominal cavity
SALIV GL,PAROTID	Parotid salivary gland
LN, TRACHEOBRON	Tracheobronchial lymph node

APPENDIX 1

Protocol Deviations

Protocol Deviations

Protocol. Test Material. Purity. 98.1% N-EtFOSE (w/w).

Actual Procedure. The purity of the test material, as determined by Centre Analytical Laboratories, Inc. on November 26, 2000, was 97.4%.

Protocol. Dosing Procedures. Method of Administration. Animals will receive test diet for at least 104 weeks.

Actual Procedure. Animal No. C92392, Group 8 female, was found without feed on September 21, 1998.

Protocol. Observation of Animals. Clinical Observations. Animals will be observeed twice daily (a.m. and p.m.). Per standard operating procedure, p.m. checks must be done at least 6 hours after the a.m. check and not before 12:00 p.m.

Actual Procedure. The p.m. room check was done at 11:52 on June 31, 1998. The p.m. room check was done 17minutes early on January 25, 2000.

Protocol. Observation of Animals. Body Weights. Body weights will be taken weekly for Weeks 1 through 17.

Actual Procedure. The body weight taken on May 25, 1998, for Animal No. C92447. Group 9 female, was excluded due to a weighing error. The body weight taken for Animal No. C92345, Group 8 female, was excluded due to a weighing error.

Protocol. Observation of Animals. Food Consumption. Animals will have food consumption recorded weekly for Weeks 1 through 16 and once every 4 weeks thereafter.

Protocol Deviations (Continued)

Actual Procedure. Food consumption values were excluded for Week 14 for animals where empty feeder weights were not documented. Documentation of spilled feed may have not been recorded during Week 76, therefore food consumption data may be in error.

Protocol. Postmortem Procedures. Palmitoyl-CoA Oxidase Tissue Collection and Analyses. At the Week 14 sacrifice, a sample of the right lateral lobe will be flash-frozen in liquid nitrogen.

Actual Procedure. Flash-freezing of the liver at Week 14 was not documented.

Protocol. Postmortem Procedures. Organ Weights. Liver will be weighed at the Week 53 interim sacrifice.

Actual Procedure. The liver was not weighed for Animal No. C92326, Group 9 male.

Protocol. Postmortem Procedures. Tissue Preservation. A selected list of tissues will be collected from each animal and stored in 10% neutral-buffered formalin.

Actual Procedure. Selected tissues to be held and not examined microscopically for animals in Group 9 were trimmed. These tissues were returned to wet tissue and not processed to slides.

Protocol. Postmortem Procedures. Histopathology. Selected tissues from each animal in Groups 8 and 9 will be examined microscopically.

Protocol Deviations (Continued)

Actual Procedure. Some tissues, required by protocol, were not available for histopathologuc examination. Missing tissues are listed with appropriate comments in the pathology data sheets for individual animals. Summary tables do not include them as having been examined.

These deviations are not expected to have affected the results of the study.

FINAL REPORT

Study Title:

104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats

Author:

Peter J. Thomford, PhD

Study Completion Date:

December 13, 2001

Testing Facility:

Covance Laboratories Inc.
3301 Kinsman Boulevard
Madison, Wisconsin 53704-2595

Laboratory Study Identification:

Covance 6329-228

Sponsor Study Identification:

FINAL REPORT

Study Title:

104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats

Author:

Peter J. Thomford, PhD

Study Completion Date:

December 13, 2001

Testing Facility:

Covance Laboratories Inc.
3301 Kinsman Boulevard
Madison, Wisconsin 53704-2595

Laboratory Study Identification:

Covance 6329-228

Sponsor Study Identification:

FINAL REPORT

Study Title:

104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats

Author:

Peter J. Thomford, PhD

Study Completion Date:

December 13, 2001

Testing Facility:

Covance Laboratories Inc.
3301 Kinsman Boulevard
Madison, Wisconsin 53704-2595

Laboratory Study Identification:

Covance 6329-228

Sponsor Study Identification:

NECROPSY

KIDNEY (KD) :
-GRANULAR MATERIAL; BILATERAL, WITHIN PELVIS: MULTIPLE TAN AND FIRM GRANULES, UP TO 1 MM IN DIAMETER
-DIFFUSELY LIGHT; BILATERAL: TAN
LIVER (LI) :
-DIFFUSELY LIGHT; ALL LOBES: TAN

BRAIN (BR) :
-COMPRESSED (HYPOTHALAMUS)

PITUITARY (PI) :
-MASS(ES); 15 X 10 X 8 MM, RED, TAN, AND SOFT
STOMACH, GL (ST) :
-DARK FOCUS(I)/AREA(S); MUCOSA: MULTIPLE BROWN FOCI, UP TO 1 MM IN DIAMETER

HISTOPATHOLOGY

LUNG (LU) :
-MINERALIZATION, VASCULAR,-MINIMAL, FOCAL
KIDNEY (KD) :
-CAST, PROTEINACEOUS,-MINIMAL, MULTI-FOCAL
-MINERALIZATION, PELVIC,-SLIGHT, MULTI-FOCAL
LIVER (LI) :
>UNREMARKABLE
MAMMARY, FEMALE (MF) :
-GALACTOCELE,-MODERATE, MULTI-FOCAL
BRAIN (BR) :
-COMPRESSION, VENTRAL,-PRESENT
-DILATATION, VENTRICULAR,-PRESENT
PITUITARY (PI) :
-B-ADENOMA,-NEOPLASM PRESENT

STOMACH, GL (ST) :
>UNREMARKABLE

DEATH COMMENT (DC) :
-PITUITARY ADENOMA,-PRESENT

FINAL REPORT AMENDMENT

Study Number:	Covance Study No. 6329-228
Title:	104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol in Rats
Date of Final Report:	October 30, 2001
Amendment:	(1) Narrative: Header study number corrected throughout report narrative and "Amended Final" placed on new headers and title page. (2) Dr. Carolyn Moyer will sign the Amended Final Report in lieu of Dr. Mark Butt. (3) Report Narrative, Introduction page I-1, paragraph 3.
Reason for Amendment:	(1) Study number in the header was not correct. Amended Final documented on revised header and title page. (2) Dr. Carolyn Moyer has returned from medical leave. (3) The signature page will now reflect Dr. Moyer's signature so this statement is no longer necessary.

I. REPORT NARRATIVE

CELL PROLIFERATION REPORT FOR:

104-WEEK DIETARY CARCINOGENICITY STUDY WITH NARROW RANGE (98.1%) N-ETHYL PERFLUOROOCTANESULFONAMIDO ETHANOL IN RATS COVANCE STUDY NUMBER 6329-228

INTRODUCTION

The purpose of the study was to assess the carcinogenicity of the test material when administered in the diet to rats for at least 104 weeks.

This report, submitted by Pathology Associates - A Charles River Company [formerly Pathology Associates International (PAI)] to the study Sponsor, 3M Toxicology Services, represents the cell proliferation findings and interpretation for Covance Study Number 6329-228 entitled "104-Week Dietary Carcinogenicity Study with Narrow Range (98.1%) N-Ethyl Perfluorooctanesulfonamido Ethanol In Rats".

REGULATORY COMPLIANCE

All aspects of the tasks associated with PAI's portion of this study were conducted in compliance with the Food and Drug Administration Good Laboratory Practice (GLP) Regulations as set forth in Title 21 of the US Code of Federal Regulations, Part 58, issued December 22, 1978 (effective June 20, 1979), and with any applicable amendments.

RECORD RETENTION

PCNA evaluation data, paraffin blocks and tissue slides are retained by PAI.

MATERIALS AND METHODS

Tissue Collection for Cell Proliferation

Five animals per sex per group in groups 8 (control) and 9 (treated) were sacrificed during week 14 for hepatocellular proliferation rate measurements. A section of the left lateral lobe of the liver from each of the 20 animals was fixed and processed to paraffin block by Covance per protocol specifications. Tissue blocks were shipped to PAI for sectioning and staining. From each block, a slide was prepared for H&E evaluation and immunohistochemical detection of proliferating cell nuclear antigen (PCNA), a marker of cell proliferation.

Immunohistochemistry for Cell Proliferation

Sections of paraffin-embedded tissues were cut ≅ 5 µm and placed on positively charged slides (Superfrost Plus, Fisher Scientific, Pittsburgh, PA) to ensure adhesion during processing for PCNA. Standard immunohistochemical methods for PCNA (Eldridge, et al., 1993) were used to stain tissues. Briefly, tissue sections were incubated with a monoclonal antibody to PCNA (Lot# 016 Exp. 10/99 DAKO, Carpinteria, CA) and reagents required for the avidin-biotin peroxidase (ABC Elite Kit K327 Lot# PK-6100 Exp. 2/10/99, Vector, Burlingame, CA) method for the detection of the antigen-antibody complex. PCNA expression in cells in all phases of the cell cycle (G1, S, G2 and M) was localized by the chromagen 3,3'-diaminobenzidine (DAB Lot# 18H8201 Exp.4/00, Sigma Chemical Co., St. Louis, MO). Tissue sections were counterstained with hematoxylin.

Cell Proliferation Measurements

Positive staining for PCNA was categorized based on cellular distribution and intensity of the brown to black reaction product that correlated with the different phases of the cell cycle (Eldridge et al., 1993). Uniform, dark brown to black nuclear staining was judged to be positive for S phase cells. A cell in the G_1 phase of the cell cycle had diffuse, stippled nuclear staining that was lighter than a cell in S phase. Cells in the G_2 phase exhibited distinct, diffuse cytoplasmic stippling with or without nuclear staining. Mitotic figures were conspicuous with diffuse cytoplasmic stippling. The percentage of proliferating hepatocytes (proliferating index PI; G_1+S+G_2+M phases combined) was determined by scoring at least 3000 hepatocytes in 10 randomly selected fields per animal. A negative control slide was included in the staining run and consisted of study tissue (animal no. C92255) that was not incubated with the primary antibody.

For cell proliferation evaluations, slides were first perused at low magnification (100X) to judge quality of staining, processing and sectioning, pattern of cell labeling (e.g., centrilobular or panlobular, extrahepatocellular proliferation, such as Kupffer cells, bile duct epithelium, endothelium), and histomorphologic changes. The later was further assessed by evaluating the serial H&E slide for each animal evaluated for cell proliferation. Cell proliferation was then quantified at higher magnification (200X) as described above.

Statistical Analysis

The Student's *t*-test (two-sided, unequal variance) was used to test for statistical significance in PI between control and treatment groups using Microsoft Excel version 5.0. A *P* value of less than 0.05 was judged to be statistically significant.

RESULTS

Cell Proliferation

Individual animal and group mean cell proliferation data are presented in Section II (Table II-1) and graphically in Figure III-1. The percentage of proliferating hepatocytes (PI) did not differ significantly in male or female rats exposed to the 1 ppm NEtFOSE at 14 weeks on study.

Histopathology

Sections from the same tissue blocks used for preparation of PCNA-stained slides were stained with hematoxylin and eosin (H&E) for histopathologic evaluation to facilitate the interpretation of the immunostained slides. Individual animal findings are presented in Section IV.

Single sections of liver from 10 male and 10 female rats representing 5 animals/treatment group/sex including control and 1 ppm NEtFOSE treatment groups were evaluated histologically. Each tissue section was stained with hematoxylin and eosin. The purpose of this evaluation was to determine whether or not morphologic changes were occurring in these tissues that may alter or confound the specificity of the PCNA staining observed in these animals.

The results showed that no significant changes that would alter the interpretation of the PCNA staining in this study were observed in the liver tissues from either the male or female rats.

DISCUSSION

In the present study, cell proliferation was measured within the liver of male and female rats from control and 1 ppm NEtFOSE after 14 weeks on study. A statistically significant increase in cell proliferation, as determined by the proliferating index (PI) was not observed in male or female rats from the 1 ppm NEtFOSE group after 14 weeks on study. Furthermore, there was no indication of a biologically relevant proliferative response.

SUMMARY

After 14 weeks on study, enhanced cell proliferation was not evident in the liver of male and females rats exposed to 1 ppm NEtFOSE.
