

Shell Oil Company
Interoffice Memorandum

PLAINTIFF'S EXHIBIT

SH-2779

JULY 18, 1990

FROM: L. C. WADDELL, JR., M.D.
TO: DR. ROBERT HUGHES - DEER PARK MANUFACTURING COMPLEX
SUBJECT: PULMONARY REGISTRY REVIEW - EMPL

This case is reviewed because of possible pleural plaques.

There are several areas on chest x-ray that are suspicious of pleural plaques. The first area that was noted on the chest x-ray is an area of apparent soft tissue thickening in the right lower lung field. As early as 1984 there was some diagnostic effort expended concerning that shadow. This led to a pulmonary consultation from Dr. Brian Walker, a pulmonary disease consultant at that time at the Kelsey-Seybold Clinic in Houston. Dr. Walker indicated that the review of the chest x-ray showed some possible shadows in that area as early as 1981 but was clearly seen on the film in 1983. A CT scan of the chest showed a small, wide-based pleural mass of low density without calcium. Dr. Tucker said the etiology of this is "possibly a benign mesothelioma or perhaps (old traumatic area of) scar tissue."

Over the years, this shadow has persisted essentially unchanged. There are also several apparent pleural based shadows noted on the chest x-ray in the left chest. On the chest x-ray dated 2/1/88, between the 7th and 8th posterior ribs and between the 8th and 9th left posterior ribs there are two shadows which run essentially parallel to each other running tangentially across the chest wall. Superior and medial to the lower of the two shadows is a small shadow inferior to the rib margin. Most recently (chest x-ray dated 5/24/90), a small area of linear calcification approximately 4mm in length has been described which is consistent with an area of diaphragmatic pleural calcification of the type that can be seen from exposure to asbestos.

A detailed occupational exposure history is down in the chart which was done by Mr. R. E. Evans on 5/24/90, which indicated that during employment at Shell he did have opportunity for at least bystander type occupational exposure to asbestos.

In summary, this is a retired Shell refinery employee who does have a past history of occupational exposure to asbestos and whose chest x-ray

CF9019902 - 0001.0.0

ABS-055609

LAM 032216

shows bilateral changes which are consistent with the type pleural reactions that can occur from inhaled asbestos fibers.

Accordingly, this case should be considered as a pleural plaque case both for purposes of counselling, which he probably has already received, and for purposes of OSHA 200 Log recording.

We are returning along with this consultation report a copy of the pulmonary registry form with our portion completed. Please indicate in the appropriate portions the date of counselling and the date of entry for the OSHA 200 Log entry.

Thank you for sending us this information for our review. If you have questions, please give me a call.

Louis C. Waddell, Jr., M.D.

NAME OF EMPLOYEE	EMPLOYEE NUMBER	LOCATION <i>DME Retired</i>
------------------	-----------------	-----------------------------

• REASON FOR REVIEW	
1. CHEST X-RAY REPORT INDICATING: a) Possible pleural abnormality ☒ b) Possible fibrosis	7. Has the employee had a job where it is possible, or likely, that he has been exposed to some other agent known to cause a dust disease of the lung, (e.g., Silica, etc.)? If so, list ☐ YES ☒ NO
2. PULMONARY FUNCTION TEST ABNORMALITY: a) FVC less than 75% of predicted b) Other <i>FEV1 66% FVC</i>	8. PLEASE LIST JOB TITLES AND NO. OF YEARS IN THAT POSITION <i>See list</i>
3. Other reason for review	9. Is there any history of other respiratory illness that could account for the X-ray abnormalities under consideration? If so, list ☐ YES ☒ NO
4. Time of service <i>Since 1953</i>	10. Is there a history of exposure to a pneumoconiosis producing agent outside of employment at Shell (prior to working at Shell or associated with a part-time job, or avocation)? If so, list ☐ YES ☒ NO
5. Has the employee worked in a facility that used asbestos so that it is possible that a pleural plaque could be related to job exposure? ☒ YES ☐ NO	
6. Has the employee worked at a job (e.g., bricklayer, insulator, etc.) for a sufficient time (usually at least 10 years) for it to be likely that asbestosis could have developed? ☒ YES ☐ NO	

• RESULT OF REVIEW: <i>Chest X-ray is consistent with A Left sided</i>	
• Recommendation: <i>Positive for 200 say "Pleural Plaque"</i>	
REVIEWED BY <i>J. W. C. [Signature]</i>
