CALSILITE

Supplementing my advices to Mr. Ditterhoefer dated February 6 (of which I sent you a copy) my attention has been called to two Canadian patents which have just come to issue, of which I am quoting the claims on the page attached.

Although the product in question is somewhat different from Calsilite, nevertheless it would appear to me that it might be interesting to consider incorporating a mixture of soap bark and karaya gum with the bentonite, for the purposes of reducing the density of the product and at the same time rendering the "dry mass capable of dry flow". This might either facilitate the setting of the mass in the molds or perhaps enable it to be extruded.
