Attached is a copy of the long awaited TSD report.

We have checked the industry for information on drum flushing and have found nothing that applies. Only one lead (DuPont-Freon) remains and I hold little hope that the picture will change.

The system described in this report must be viewed as an experimental unit which will probably require modification after installation in order to make it entirely satisfactory.

The monkey is on our back now. We should accept the cost and timing or supply further guidance to the Anniston and Krummrich plants.

I suggest that we discuss this at our next staff meeting.
