Two-unit Cinch anchor (threaded) installed. Bolt can be removed.

Cinch anchors solve the problem of securing a firm anchorage in masonry. Vibration, no matter how severe, cannot loosen their grip. Moreover, they are *guaranteed* to hold beyond the tensile and shearing strength of any wrought-iron or steel bolt.

Made in sizes to hold a few pounds or a hundred tons.

Write for catalog, "Cinch System of Anchoring," which gives full particulars and illustrates uses in engineering field.
