Mr. Paul Lange
Employers Mutuals of Wausau
6620 W. Capital Drive
Milwaukee 16, Wisconsin

Dear Mr. Lange:

With reference to your letter of September 23, 1957, the asbestos content in CAFCO Spray is as you indicated, relatively small.

The amount of dust produced during application is dependent upon the feed rate, and the amount of water used to wet the fiber. The company has available a dust control system which most applicators use. This device eliminates most of the dust.

The dust that is produced can be eliminated with adequate ventilation. If working conditions are such that the area is dusty, then respirators should be used. The respirators available from this Company, and the type supplied with the application equipment are approved by the Bureau of Mines as Permissible Respirators for Dusts, and Pneumoconiosis - Producing Mists.

Please advise if you require any further information.

Very truly yours,

COLUMBIA ACOUSTICS AND FIREPROOFING COMPANY

F. M. Stumpf
