

C O P Y

WONESS HOSPITAL
CINCINNATI, OHIO

Name: [REDACTED] Referred by Dr. Machle Date: 11-1-1939
Address: #103 Part Radiographed: Chest

Roentgenological findings:

Stereoscopic x-ray examination of the chest shows slight increased peribronchial tissue throughout both sides of the chest, slightly more marked in the upper right and left lobes. Over the right lobe there is noted slight pleural thickening. There is no infiltrate in the parenchyma of the lung tissue suggestive of a tuberculous infection. Small calcifications are noted in the hilus region indicative of healed infection. The diaphragm surfaces, also the heart and aortic shadows, show no abnormal finding.

Signed: E. R. Bader, M.D.
