November 22, 1983

Dale Vinson
Rt. 3 Box 1424
Libby, Mt 59923

Dale:

A series of personal air samples were taken on you November 4, 1983 while you were filling and loading bags of vermiculite into a railcar. The samples were analyzed for asbestos fiber in the form of tremolite, and your time weighted average (T.W.A.) was determined to be 2.11 fibers per cubic centimeter of air (f/cc) for the 6 hour time period that you were sampled for. Based on previous sampling done at the bagging and loading facility, we would expect your normal 8 hour T.W.A. to be less than the 2.0 f/cc standard for asbestos fiber exposure set by MSHA.

If you have any questions concerning this matter, please feel free to contact us.

Sincerely,
