Pesticides Investigations
987 Jedemith Drive
Sacramento, California 95819

Dear Mr. Woods:

In reply to your letter of February 27, I have enclosed a table showing the general physical properties of our Aroclors. At the bottom of this table I have added the results determined in oral toxicity studies with rats and the minimum lethal dose of the Aroclors when applied to the shaven skin of rabbits. You will notice that there is a difference in the manner in which the sample is administered due to the physical form of the sample, its viscosity, solubility, etc.

We believe that these data show that the Aroclors are not seriously toxic from the standpoint of acute single exposures.

A second enclosure is a reprint describing the results of chronic inhalation experiments on two of the Aroclors. This work has led to the establishment of a threshold limit value of 1.0 milligrams per cubic meter for Aroclor 1242 and 0.5 milligram per cubic meter for Aroclor 1254.

Perhaps I should point out that our designation of the Aroclors by numbers indicates the parent material and the degree of chlorination. For example the 1200 series are biphenyls chlorinated to various percentages. Thus, Aroclor 1242 is biphenyl chlorinated to the extent of 42%; Aroclor 1254 is biphenyl chlorinated to 54%. The series beginning with the numerals 24 and 44 are

Mr. Lester A. Jones

-6-

chemical chlorinated biphenyls and chlorinated triphenyls.
The 15 series are chlorinated triphenyls.

All of the Aroclors are practically insoluble in water. For example Aroclor 1248 is soluble in water at 25°C only to the extent of 293 plus or minus 10 parts per million, Aroclor 1248 100 plus or minus 14 ppt and Aroclor 1254 50 plus or minus 2 ppt. Obviously increasing the chlorine content decreases the solubility of the material.

If I could be of any further assistance, please let me know.

Sincerely,

Elmer F. Wheeler
Manager, Environmental Health
