involved.

Q And do you recall any tests that were done at Saranac Lake in New York to determine that the fiberglass -- breathing the fiberglass also would not hurt you?

A Breathing fiberglass? You couldn't breathe it. That is what I am saying.

Q The small fibers?

A No, no fibers got into your lungs. They never made fine enough to breathe, and as far as I know, I have been away a long time, we never had any problem.

Q In the 1940s with regard to the fiberglass pipecovering, did Owens-Corning consider it its responsibility to find out about the characteristics of the -- the health characteristics of fiberglass before they put it on the market and started selling it to people?

A The fiber that it was made from had all been tested, and as far as we can tell, there was no -- nobody caught anything from it.
