## NOTES ON CASE

Case No. \_\_\_\_\_

Name \_\_\_\_\_

9-10-31

Has been well all of life till March 1928 - when one day - 20 min after starting truck was seized with vertigo, dimness of vision and weakness as result of exhaust fumes in cab which were frequently very heavy. Recovered 30 min after leaving cab. In 1929 & 1930 attacks recurred at frequent intervals without any association with or exposure to exhaust gas. Headache was pronounced symptom in 1920 - for one period during Sept. last three weeks without relief. There has been occasional dimness vision and jelling fullness in ears - gossamer like diplopia. No chills, fever or rashes. No localized neurological symptoms. Bowels have moved 10-12 x day for past 3 years green watery stools - no catarrhus. Frequent lower abdominal pain.

Physical findings aside from fever ~~and~~ undernutrition and ~~the~~ evidence of infection on the teeth and tonsils are essentially negative.   
 *assumed that symptoms and physical findings by the chronic*

NOTES ON CASE

Case No. \_\_\_\_\_

Name \_\_\_\_\_

infection present in the mouth and tonsils.  
The original illness in March 1928  
may very well have been due to exhaust  
gas exposure but there is no evidence  
that the present illness is in any way  
related in cause.
