Communication SUBJ: TRACE COMPONENTS IN PRODUCTS

VISTA

As you are aware, the requests for specific data or statements regarding product constituents have increased. In many cases, this is a result of the OSHA hazard communication standard which requires any carcinogens present at greater than 0.1% and all hazardous materials greater than 1% (if the mixture has not been evaluated for hazard) to be listed on Material Safety Data Sheets. The recent Lubrizol request is a good example of this issue.

To assist us in responding to these requests I have enclosed the OSHA carcinogen list. This is a compilation of the reference sources OSHA considers for carcinogen identification.

Where reasonable, and with your help, I would prefer the responses for these requests came from this office.
