Dear Sir:

Acknowledging your recent letter, I have arranged for us to tip you off as to any possible changes and I have it a practice automatically to let you know of any changes that will be published in the Journal and at the same time I will suggest to the authors that they might offer the paper in question for the spring program. This arrangement will be ahead automatically so you need not trouble to write me about it.

As to the Cummings lecture, I can't think of a better person to discuss toxic limits than you but I do not feel that the subject is at all what we shall have for the Cummings lecture. I admit the question is one of great importance in industrial hygiene control and administration but it is hardly science and I do not see how it can be made into science. For that reason I would not mention it if one of urgency came up. I would much prefer to see a speaker such as Howard or Hale on the control of the use of industrial solvents. As I say: the ability to see the direct relationship between the science of a problem and a practical solution with the application, I feel that you consider it is important to work and with the mind and I am sending a copy to Secretary Barnes.

Sincerely yours,

Philip H. H. H.
