With reference to your letter to R. E. Hughes dated January 31, 1973 concerning the asbestos fiber concentrations reported in my letter to you dated January 29, 1973, see attached Table I for the asbestos fiber counts.

As can be seen from these results, the asbestos concentration can vary over a broad range depending upon the nature and condition of the specimen and how it is handled. Under no circumstances should any specimen be torn or "shaken out" since this will most likely result in exceeding the short-term ceiling concentration of 10 fibers per cubic centimeter.

If there are any questions, I'm interested in hearing about them.

E. Wilbur Speicher, Administrator
Headquarters Industrial Hygiene
