

Locomotive base casting in gray iron.

Precision mold for television tube.

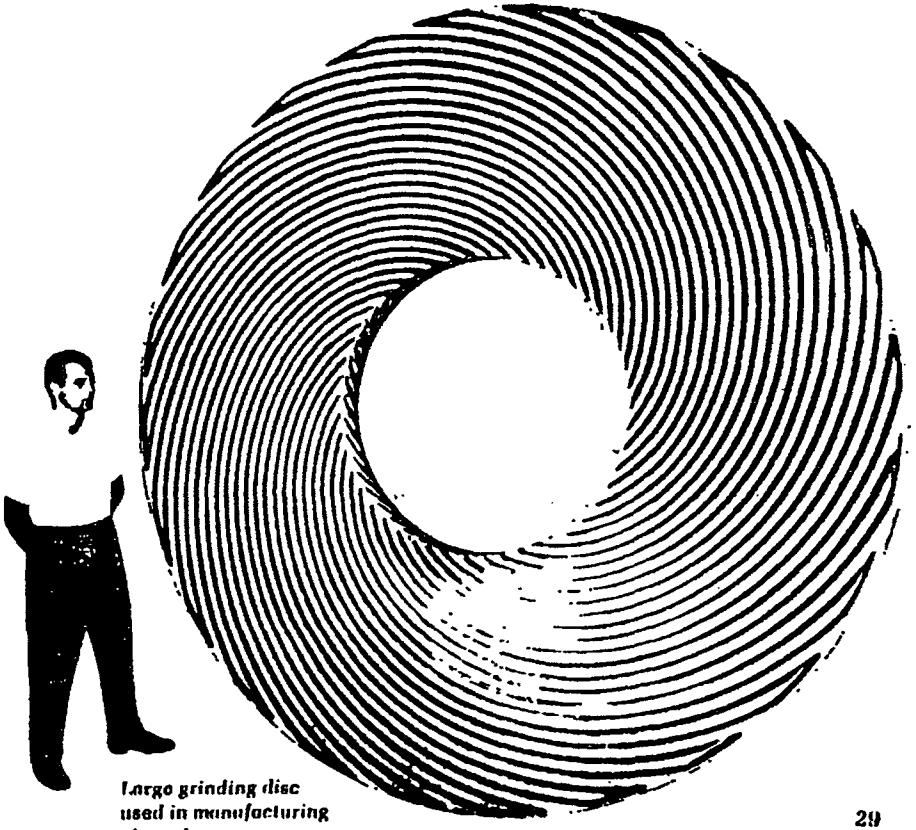

Automotive body stamping die.

In addition to using all commercial foundry practices, the division has casting techniques that permit the production of "cast-to-size" molds of intricate detail. These molds are used by the rubber, glass, plastics and ceramics industries, often with a minimum of finishing.

Applications for such castings are as varied as the alloys and techniques available. They are used in large steam generating equipment, for grinding glass, for molding television tubes, to grind rubber, to mold vehicle tires, to launch missiles, to shape auto bodies, manufacture dolls—and for machines, pumps, engines and equipment throughout industry.

Half of mold for off highway tire.

Large grinding disc used in manufacturing plate glass.
