Thank you Bob for sanding me a copy of James McKee's memo October 3rd to J. T. Nolan.

The release of praliminary findings on the Japanese study received farily wide publicity. However, this is far from the first claim for bacteria with PCB breakdown potential.

I would recommend that we at this stage esk the Japanese for more details of their experiments and have these reviewed by Bob Keller's group to see if greater merit exists in this particular case than in some of the earlier U.S. and Canadian work.
