LUZENAC, le 8th february 1977

Dear Mr Aghton

I thank you very much for the copy of CTFA specification for Cosmetic Talc.

We already had developped an X ray method for checking the absence of asbestos with the mineralogic department of Toulouse University.

We had a good surprise when are discovered that our method was exactly the same as CTFA method J 4-1.

We are now very concerned with the 90 % limit of hydrated magnesium silicate excluding chlorite, we feel that this limit has been made against Luzenac talc wich is very unfair as chlorite has same properties as talc and no evidence of any hazard has ever been discovered.

Anyhow we will be very pleased to meet in your Luzenac and to show you our mines wich are opened from may until october.

With best personal regards.

JP GRANGE
