Dear Dr. Case:

On April 15,1983 I performed ocular eaminations on a group of approximately two year old Sprague Dawley rats being used in 3M study 0281CR-0012. All rats had their eyes previously dilated with 1% atropineprior to ocular examination. A Fison indirect ophthalmoscope was used to examine the anterior and posterior ocular segment.

All findings were recorded in the laboratory notebook as per the Good Laboratory Practices Act.The changes observed in this group of animals namely a random distribution of cataracts is seen as normal ageing changes in the lens of rats of this age.There were some chronic uveitis cases and superficial keratitis problems but these again would be expected in a group of animals of this age. No ocular findings could be observed that were indicative of the compound under study. If I may answer any additional questions that you have please let me know.

Sincerely,
Stephen Bistner DVM

TITLE: Protocol for Two Year Oral (Diet) Toxicity-Oncogenicity Study of Fluorocarbons FM-3924 and FC-143 in Rats. (Riker Study No. 0281CR0012)

OBJECTIVE: Evaluate chronic toxic and oncogenic affects of FM-3924[a] and FC-143 in a two year rat study.

TEST ARTICLES: FM-3924[b] and FC-143[c], 3M fluorocarbons. The compounds will be supplied and, as appropriate, well characterized analytically by the Commercial Chemicals Division/3M, St. Paul, MN. Approximately 1.0 kg of FM-3924 and 2.0 kg of FC-143 will be needed for the study.

CONTROL ARTICLE: Ground Certified Purina Laboratory Chow #5002.

SPONSOR: Commercial Chemicals Division/3M.

TESTING FACILITY: Safety Evaluation Laboratory, Riker Laboratories, Inc., St. Paul, Minnesota.

DOSING INTERVAL: February - March 1981 through February - March 1983. The study director will issue a detailed study schedule before start of study.

TEST SYSTEM: Three hundred and thirty male and 330 female Charles River CD rats, 38-42 days old on dose day 1. The rats will be housed in hanging stainless steel cages with wire mesh floors and fronts (male - 1/cage, females - 2/cage). The room will be temperature and humidity controlled with the lights on a 12 hour light/dark cycle.

JUSTIFICATION FOR SELECTION OF TEST SYSTEM: Charles River CD rats will be used because of background data obtained from previous subchronic toxicity studies in that strain of rat.

TEST SYSTEM IDENTIFICATION: Each animal will be assigned a number which will be indicated on the outside of the cage and on an individual ear tag.

[a] FM-3924 is technical grade FM-3422
[b] Also coded as T-2999CoC
[c] Also coded as T-2998CoC

RANDOMIZATION OF TEST SYSTEM: Animals will be assigned to the various groups by using a computer-generated random number method.

DIET AND OTHER FORMULATION/ANALYTICAL SPECIFICATIONS: Treated and untreated ground certified Purina Laboratory Chow #5002 and water will be available ad libitum throughout the study. Fresh mixtures of the test article and diet will be physically mixed every one to four weeks, depending on the stability of the test articles in the chow.

The sponsor will provide the necessary analytical support to characterize the test articles and the test article diet mixtures. Prestudy analytical results of the test articles must be forwarded to the test facility before the study will be initiated. Analytical characterization of the test articles will be determined prior to and at the completion of the dosing interval. Stability of the test articles in diet will be determined prior to the dosing interval using trial blend(s) or from the first blend for the dosing interval. Representative samples of each test article diet mixture will be collected by the test facility during week 3 or 4 and approximately every 13 weeks thereafter and will be submitted to the Commercial Chemicals Analytical Laboratory/3M for test article content and uniformity-of-concentration analyses.

DIETARY CONTAMINANTS KNOWN TO BE CAPABLE OF INTERFERING WITH TEST ARTICLE AND ACCEPTABLE LEVELS THEREOF: No dietary contaminants are known to interfere with the test article. However, the certified diet has been analyzed by the vendor for heavy metals, aflatoxin, chlorinated hydrocarbons, PCB, and organophosphates.

DOSAGE LEVELS, ROUTE, GROUP, SIZE, ETC.: Oral (diet) dosing will be used because it appears to be an appropriate route to use for evaluating long term toxicity-oncogenicity. Also in the previous subchronic rat toxicity studies this route was used and at higher doses toxic effects were demonstrated.

Test article mixtures and the control article will be given to the animals in glass food jars. Fresh treated and untreated diet will be changed on a weekly basis.

Dose Group	Dosage Level	Group Size
Control	0 ppm	50♂, 50♀
High FM-3924	100 ppm	65♂, 65♀
Mid FM-3924	30 ppm	50♂, 50♀
Low FM-3924	10 ppm	50♂, 50♀
High FC-143	300 ppm	65♂, 65♀
Low FC-143	30 ppm	50♂, 50♀

METABOLIC DISPOSITION OF TEST ARTICLE: Previous oral (diet) subchronic toxicity studies have indicated oral absorption because compound toxic effects were produced in rats. Also preliminary metabolism studies have shown oral absorption occurs in the rat.

During this study overnight (≈ 16 hours) urine and feces samples will be collected periodically from 5 rats/sex/dose group for analysis, as appropriate, of total organic fluorine, FC-143, FM-3422 or FC-95 (possible FM-3422 metabolite). These urine and feces samples will be collected at 2, 5, 11 and 23 months. Also at the scheduled 1 and 2 year necropsies, tissue samples - liver, blood, kidney, spleen, lung and bone marrow (femur) - will be saved from 5 rats/sex/dose group (other tissues might be suggested during the course of the study). After collection, the samples will be stored frozen.

These samples are not considered an intergral part of the toxicity-oncogenicity evaluation of FM-3924 and FC-143 in rats but are taken because they may supply useful supplemental metabolic information. All the samples will not necessarily be analyzed; the extent in which they are analyzed is a matter of scientific judgement by the sponsor. The sponsor representative will be responsible for coordination of these analyses. The results of these analyses will be reported in a separate report which will be a supplement to the toxicity-oncogenicity report.

CLINICAL OBSERVATIONS: Clinical observations, including palpation for possible tumors, will be recorded once a week (every 5 to 8 days); observations on all other days will be basically live/dead checks. If an animal has evidence of difficulties, it should be observed more closely so it can be euthanatized before death to obtain satisfactory tissue samples. Body weights will be recorded and food consumption will be determined once each week for the first six months, then once every four weeks until termination. The test compounds will be administered at constant ppm in diet throughout the study.

EYE EXAMINATIONS: Eyes of all the control and high dose rats will be examined by a staff veterinarian by indirect ophthalmoscopy and/or slit lamp biomicroscope at the start of the study (if possible before compound administration starts), near the middle of the study (≈ 12 months) and during the final month of dosing. Eye abnormalities found on daily observations will be called to the attention of the staff veterinarian for further definition, as deemed necessary by the Study Director.

CLINICAL PATHOLOGY: The clinical laboratory tests listed below will be conducted on 15 male and 15 female rats from each group at 3, 6, 12, 18 and 24 months. Animals selected at each time interval will be made by the use of random numbers. Blood will be obtained via venipuncture of the orbital sinus. Urine will be collected in stainless steel metabolism cages.

TISSUE PATHOLOGY: Gross necropsies will be conducted on all rats in the study. Any rat in a moribund condition should be terminated to insure satisfactory tissue samples (see below list). Samples of the various tissues will be collected from any rat which had died unless severe autolysis is present in a tissue. As an absolute minimum samples of lung, liver, kidney, brain and any tumor mass will be collected. An interium necropsy of 15 males and 15 females from each of the two high dose groups will be done at 1 year to determine if there is an indication of an oncogenic response at that time. At the end of the study, all surviving rats will be killed for gross necropsy. Samples of tissues to be fixed in 10% buffered formalin are listed below. At the 1 and 2 year necropsies, wet weights will be obtained on those tissues identified with an * on 15 rats/sex/group, selection of animals by random number tables. Weights for paired organs will be recorded as a combined weight and if an organ to be weighed is involved in a large tumor mass, a weight will not be taken. (Note: Body weight will be determined on these 15 animals/sex/group prior to necropsy for calculation of relative organ weights.)

Microscopic examination of formalin-fixed stained paraffin tissue sections will be performed for all animals in control and both high dose groups, including all animals in these groups dying or euthanatized during the course of the study.

In addition, the following tissues will be examined microscopically from all animals in the low and mid dose groups; liver, kidney, gonads and all tissue masses. The remaining tissues listed above from all low and mid dose level animals will be saved for possible future reference. Microscopic evaluation of additional tissues from animals in low or mid dose groups will be performed if indicated by experimental findings at the high dose level.

Appendix Item H (continued)

DATA ANALYSIS AND FINAL REPORT: The proposed statistical methods to be used for analysis of the data are: Dunnett's test for organ weights, percent difference from control for body weights, Chi-square for percent mortalities, tumor contraction probabilities, percent tumor bearing animals and tumor incidences; clinical pathology values will be compared to control animals and normal ranges. (Note: If at the time the data are to be analyzed other methods seem more appropriate, those other methods will be substituted for or used in addition to those already cited.) Since it could take up to 12 months to process and read all the tissue sections, the proposed date for the final report is 15-18 months after final necropsy (approximately 3-6 months after slide reading is completed).

Amendments to the Protocol for Two Year Oral

(Diet) Toxicity - Oncogenicity Study of Fluorocarbons

FM-3924 and FC-143 in Rats (Riker Study No. 0281CR0012)

Discussions by M. T. Case, F. D. Griffith, J. D. Henderson and L. J. Sibinski resulted in the following three amendments to the Protocol:

1) Due to an unforseen amount of time to refine the analytical procedures with the test articles in diet, the dosing interval has been changed from February-March, 1981 through February - March, 1983 to April-May, 1981 though April-May 1983.

2) The number of animals in the control group has been increased from 50 male and 50 females to 65 males and 65 females. These extra 15 male and female rats will be necropsied during the scheduled one year interim necropsy.

3) The physical nature of FM-3924 prohibits a uniform, direct mixture of this test article in diet. The test article will be solubilized in a carrier (ethanol) to yield a concentrated mixture. This diet concentrate of FM-3924 will be mixed with non-treated diet to yield the assigned dosage levels.

Two Year Oral (Diet) Toxicity-Oncogenicity Study
of Fluorocarbon FC-143 in Rats

Amendments to the Protocol

As of study day 183, body weights and food consumption will be recorded once every two weeks.

Due to the unexpected leaving of Dr. J.D. Henderson, the staff veterinarian from Riker Laboratories, the final eye examination of the surviving controls and high dose FM-3924 and FC-143 rats will be performed by Dr. Steven Bistner, DVM, a consulting veterinary ophthalmologist.

Palpation for possible tumors (masses) will occur during the weekly observation for clinical signs.

Inadvertently, no tissues were taken from the male rats during the one year interim necropsy for the Metabolism group.

A white powdered solid labeled FC-143 Lot 37 (F-6052 Lot 94) (T-3141 COC) was received originally on October 28 and December 3, 1980 for characterization and analysis. This material was analyzed and used in several studies including the two year feeding study (T-3998COC) Riker Study #0281CR0012. The sample was re-analyzed for post 0681 TB0398 study with sample received from D. Ricker 29 Jan. 82. Sample was 100% solids.

The sample analyzed as follows:

GLC of Methyl Esters

Spectroscopic

Infrared spectra #16474-1 and 17958-1 are identical and match reference spectra.

NMR spectra H 8386, F 8388-9 (Pre) and F 10163-4 (Post) are identical and match reference spectra. The chain is 79% straight chain, 9% $(CF_3)_2CF$- branching and 12% back bone branched.

Conclusions

FC-143 Lot 37 has an analysis within specifications, is stable and is representative of commercial material.

A white, powdered solid labeled FC-143, Lot 37 was received on May 17, 1982 for analysis for a mid study evaluation. The material was analyzed with the following results:

GLC Data	(Methyl Esters) Area %
C_6 Acid	0.25
C_7 Acid	0.65
C_8 Acid (all isomers)	98.6
C_9 Acid	0.2
C_{10} Acid	<0.1
C_x Acid	0.3

F^-	0	17 ppm

Titration for NH_4^+ to determine equivalent weight.

Theoretical eq. wt. = 431
Found 433

Infrared spectrum #18319-1 matched reference spectra.

Conclusions:

All results are within experimental error or previous ones, so there has been no change detected in FC-143, Lot 37.

Blended into Ground Lab Chow

Laboratory Request #16882

Commercial Chemicals Analytical
Laboratory Method #G31-0481

Three samples of FC-143 blended into Ground Lab Chow along with a blank lab chow sample were received from L. J. Sibinski on 2-23-81 for analysis. The samples were labeled as follows:

Compound	FC-143 Theoretical ppm
FC-143 Top Sample	200 ppm
FC-143 Mid Sample	200 ppm
FC-143 Bottom Sample	200 ppm
FC-143 Blank	0 ppm

All four samples were analyzed for content and stability on the initial blending day (2-23-81) and on week 1 and 2 post blend. The post blend samples were prepared by placing the Ground Lab Chow in 4 oz. jars on 2-23-81 and placing them in a metal cabinet without the covers on the jars, leaving the samples open to the air. The 1 and 2 week post blend samples were taken from the jars on 3-2-81 and 3-9-81. The results are as follows:

	ppm (ug/g) FC-143 on		
Compound	2-23-81	3-2-81	3-9-81
FC-143 Top Sample	192	212	201
FC-143 Mid Sample	221	183	173
FC-Bottom Sample	183	183	159
BLANK	0	0	0

FC-143 stable for one week on chow but unstable for 2 weeks,

Appendix Item J

The analytical results show some variability which needs to be explained. During our GLC method development for FC-143, we found that 0.1 or 0.2 gram samples of the Ground Lab Chow did not have a uniform distribution of FC-143. The particle size of the FC-143 powder is extremely critical when mixing it with the Ground Lab Chow at the 200 ug/gram level. We now use 1.0 to 2.0 gram samples in our GLC analysis, which gives us a more homogeneous sample, but does not completely eliminate the non-uniformity of the FC-143 in the Ground Lab Chow.
