SUBJECT Pydraul 312 Toxicity & Safe Handling

REFERENCE

TO : Dr. Emmet Kelly
Dr. M.N. Johnson

Thank you for your fine support during my recent rash of frequent requests for Pydraul 312 toxicity and safe handling letters to our West Coast accounts.

I would like clarification from you on several points regarding these reports. Specifically on the letters to Kaiser, Trentwood Works, Spokane, Washington and McCulloch Corp., Los Angeles.

In the case of McCulloch, was the information you provided sufficient for their safety nurse to understand how to treat Pydraul 312 "over exposures"? The McCulloch nurse wanted a report that she could use to insure that she would understand how to treat Pydraul exposures should they occur. Similarly she wanted to make sure that the eye-wash compounds she had in stock were appropriate for treating Pydraul 321 exposures.

In the case of Kaiser Aluminum in Spokane we were requested to provide Pydraul 312 information of a different nature, as per my call report copy to Dr. Kelly. They wanted in addition to recommended first-aid procedure and supplies, a briefing on what effects might result from untreated or chronic exposure to Pydraul 312. It seems that in both cases the companies were answered regarding effects but not on treatment and supplies. I realize treatment and first-aid supplies are mentioned in our Pydraul literature. However, are we in a position to be a little redundant in our reports by re-emphasizing these areas and including some general comments so these safety people can insure their present first-aid program is understood and appropriately stocked?

Perhaps I haven't been providing your office with a clear understanding of my needs or I just don't understant the "practical application" side of your reports to Kaiser and McCulloch.

I look forward to your comments so that I can better serve our Pydraul customers.

Best personal regards,

D.R. Pogue
