
What Price Pork Chops ?

Meat Industry Speeds Production and Lowers Costs Through Glidden Research

● It takes about 12 bushels of corn, costing $15.60* at current prices, to produce 100 pounds of pork. But when corn is mixed with protein derived from soy beans, this cost is reduced to $8.95—a 43% net saving.

Another saving is in time. Thus, the time required for producing a 200 pound hog is cut from 11 to 5 months through supplemental protein feeding.

Glidden protein is available to farmers not only in a complete, ready-to-use feed for livestock and poultry —but as a concentrate which can be mixed with the *farmer's own grain. Glidden pioneered in the protein* concentrate field.

In addition to protein feeds and many other soy bean achievements, Glidden is a leader in the fields of foods, chemicals, pigments, resin products, paints and powdered metals. Glidden research has helped many manufacturers to solve specific industrial problems. Perhaps we can help *your* business. Your inquiry will be most welcome. The Glidden Company, Cleveland 2, Ohio.
