

SINTERING FURNACE
GREAT LAKES STEEL CORP.
Drawing Series 21296-A

Detroit Office

Dec. 9, 1958

Mr. Irv. Holubovsky
Chicago

Dear Irv.:

Confirming our telephone conversation and supplementing our letter to Harold Rowley dated Dec. 2, 1958, we enclose herewith a sketch showing a method for applying a carborundum veneer to 10" Detrick tile. *signed*

As explained in our telephone conversation, although we can find no record of it locally, we remember having seen this method applied to our tile in conjunction with boiler walls at the grate line.

There has been no further information received from Great Lakes in regard to further change in design since our telephone conversation.

At present, we anticipate receipt of an order for the roof described in our letter of quotation of Dec. 2. Please proceed on this basis to complete our present drawing 21296-A including a bill of material utilizing the flat roof and 12" radial noses at the bottom of all four walls.

We will use this installation until such time as we develop a Carborundum Veneer. These completed drawings along with a bill of material will enable us to place an order for tile and castings of sufficient size to keep this unit in operation until we can sell them on our design of the veneer.

I cannot over-emphasize the fact that this engineering is urgently needed on the jobsite.

Yours very truly,

J. M. Edgar
