Subject: Questions from 8/7 pace meeting

gentlemen, here are some answers to questions asked of me at yesterdays pace team meeting to manage existing processes with C-8.

What are the levels of C-8 around the FEP coagulators. There have been 5 samples taken in the last two years. The results are 2.01,0.11,0.06,0.22,0.29 PPB. There are NO samples in the PPM range.

What are the levels of C-8 in PSR resins? The C-8 levels in PSR have reduced from 25 ppm to 2 ppm with the use of the continuous belt.

Roger.
