Hello [REDACTED]
As you say, the burst disk is intended to operate as an emergency measure to protect the plant and safety.
Did you carry out a root cause investigation? If so can I have a copy.

Yes, you will need to incorporate all the emissions into the PI.

Subject: Part A Query

You don't often get email from [REDACTED] [Learn why this is important](#)

Hi [REDACTED],

A bit unsure if this requires a Part A, but would appreciate your thoughts, we will include the TFE released in the Pollution Inventory Submissions in February.

On 3rd December ETFE operators identified abnormalities in the levels of TFE being recycled within the plant. The investigation established that a relief stream (burst disc) had a partial failure, once identified the ETFE plant stopped operation on the affected stream and the system was isolated preventing further release.

This has resulted in approx. 995kg TFE and 57kg Ethylene being released between approx. 00.00 2nd December and 22:28 on 3rd December via the relief stream. The relief stream is a permitted release point in the permit A9, there are no monitoring requirements or limits set for these emission points, but we have previously reported emissions of TFE from relief streams.

Would it be possible to confirm if you require this event to be incorporated only in the annual pollution inventory or reporting via a Part A report?

Kind regards,
[REDACTED]
