

Get both process heat and space heat with one system

Monsanto's Therminol® heat transfer fluid gives you a fire-safe, low cost liquid phase system that does two big jobs at once

It's no trick to wring two systems' worth of work out of one Therminol FR heat transfer system because you can count on positive, precise (±2°F), flexible temperature control. A Therminol system will run as hot (up to 600° F) or as cool (down to 0° F) as you want it. It can supply high heat to a hot process, or moderated heat to space heating lines . . . all at the same time . . . and do two jobs at once. Nice work, but that's only the beginning.

Therminol FR fluids provide extra safety because they do not support combustion—even when exposed to direct flame—and require no system pressure. They are the only heat transfer fluids listed by Underwriters' Laboratories and recognized by F.I.A. and F.M.A.

Therminol FR fluids save money because nonpressurized, liquid-phase heat transfer eliminates the costly construction and expensive monitoring and safety devices you need with high pressure systems. A Therminol system can even be monitored remotely.

Therminol fluids are thermally stable, chemically inert, noncorrosive and nonvolatile. Properly maintained, a Therminol system operates indefinitely and requires no makeup.

Therminol heat transfer is the first choice in new installations, but the economy, safety and efficiency of these systems often make them look good for conversions. Find out more about how Therminol could work into your plans by returning the coupon.
