The following was obtained from A. Vendette:

Santicizer 1172 is a new product, tri "Alfol 610" trimellitate. They recently produced 50,000# for Japan. The production run was accompanied by nothing but success - good yields, good color and good electricals.

To the contrary production of S-1170, tri-2-ethylhexyl trimellitate is plagued by problems - poor yield and color, poor PVC performance and electricals.

Consequently they are planning to switch their customers from S-1170 to S-1172. Unfortunately they have little technical data. Vendette requested copies of competitors' literature which we might have. I promised him this plus what screening data we have.

Also, I requested a gallon sample of S-1172 for our evaluation and future use.
