

CHEMICALS

INTEROFFICE / LAKE CHARLES

TO	Ron Williams	DATE	September 12, 1985
FROM	Clyde Dennis	SUBJECT	Stationary VC Monitoring Systems

In regard to the stationary monitoring systems Items (2.C, Pg. 8), I talked with Glen LeJeune, Instrument Mechanic, and Walter Buller, Maintenance Supervisor, on September 12, 1985.

They provided the following information:

1. Field mounted sample points are pressure checked once a year.
2. A specified level of VC is introduced from a N.B.S. standard bottle into each sample point once a year. This sample is allowed to flow from the sample point to the instrument to determine the instrument is reading properly.
3. Instruments are checked daily at the analyzer building.
4. Documentation is available on the above activities.
